Section 1: Getting Started

THANK YOU...

...for choosing an LX610e Color Label Printer. The LX610e Printer will print razor-sharp text and barcodes, vibrant colors, and even stunning photo-realistic photographs directly onto rolls of labels, card stock and a variety of other approved media. AND with the built in digital die cutter you can cut and create your labels in any size or shape you choose.

This User's Manual is your complete step-by-step guide to quickly and easily setting up and printing with your new Color Label Printer!

1A Choosing a Good Location

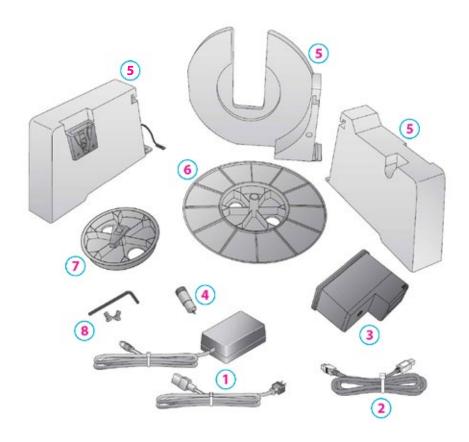

- Place the printer on a flat surface in a location with adequate air circulation to prevent internal heat buildup.
- Do not place the printer near heat sources such as radiators or air ducts, or in a place subject to direct sun light, excessive dust, mechanical vibration or shock.
- Allow for adequate clearance in front of the printer to accommodate the printed label stock as it is leaving the printer to avoid the possibility of binding or jamming of the label stock.
- Allow for 6" of clearance behind the printer to accommodate loop creation during cutting operations. The area directly behind the printer must also not be obstructed by USB or power cables connected to the printer.
- Allow for adequate overhead clearance for opening the top cover to allow easy access to the labels tock and ink cartridge. The printer will require 7 inches (17.78 cm) of additional space on the top side to completely open the cover (Total = 16.5" or 41.91 cm).

1B Unpacking and Inspection

While unpacking your printer, inspect the carton to ensure that no damage has occurred during shipping. Make sure that all supplied accessories are included with your unit. The following items are included in the supply box:

- 1. Power Adapter and Cord
- 2. 6' USB Cable (If other USB cable is used, it must be 6' (2 M) or less)
- 3. Color Dye Ink Cartridge Part Number 53496 (Pigment is also available Part Number: 53491)
- 4. Die Cutting Knife Holder with knife preinstalled
- 5. Label Roll Holders (Assembly required section 1C)
- 6. Large Roll Hub
- 7. Small Roll Hub
- 8. T8 Allen Key and two screws
- 9. Printed documentation

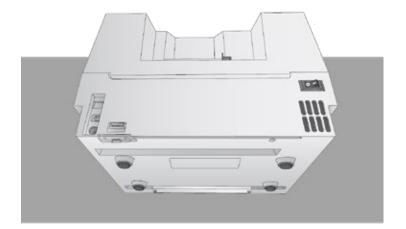

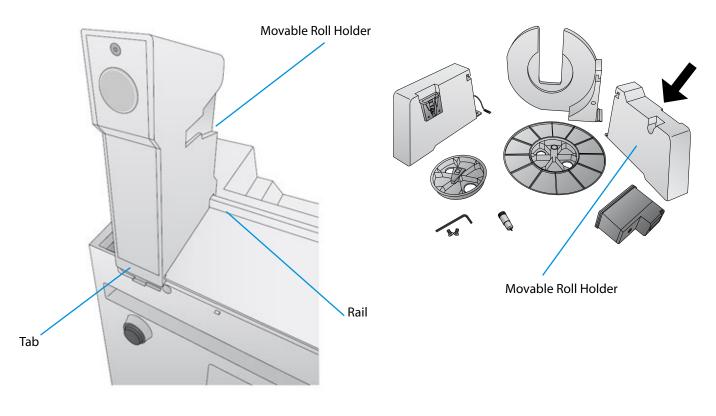

1C Installing the Roll Holders

Some light assembly is required before operating the printer.Follow these instructions to install the roll holders.

1. Set the printer on its front so the bottom is facing you

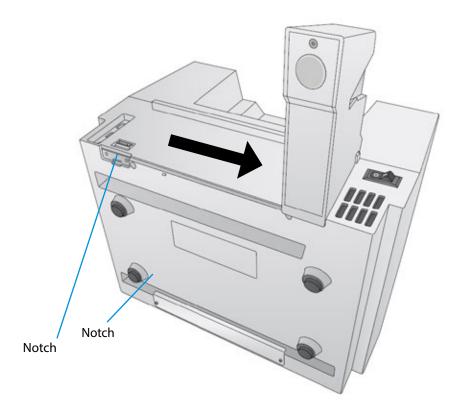

2. Install the movable label roll holder by attaching the hooked end on the rail. The bottom of the holder will fit in the notch on the printer.

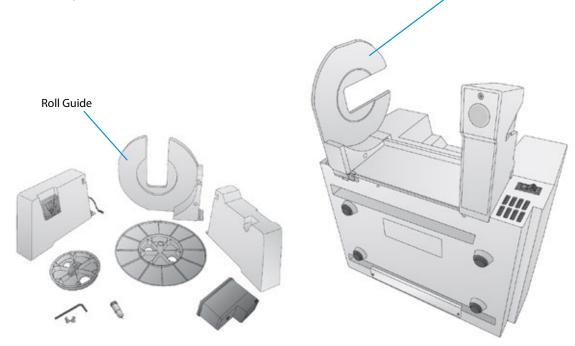

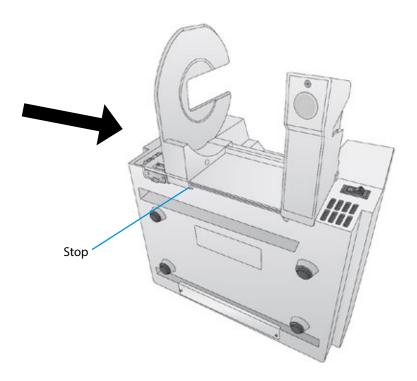

3. Slide the Roll Holder to the far right.

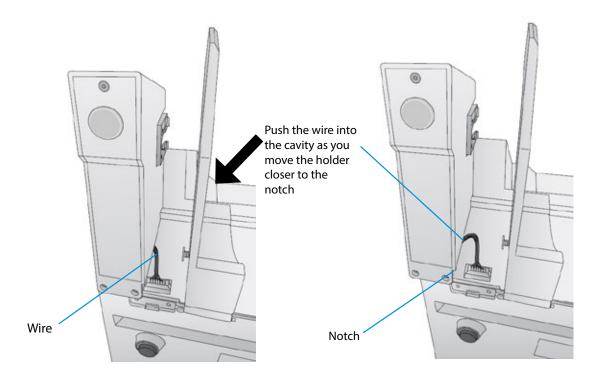

4. Install the roll guide by attaching the hookedend on the rail. The bottom of the holder will fit in the notch on the printer.

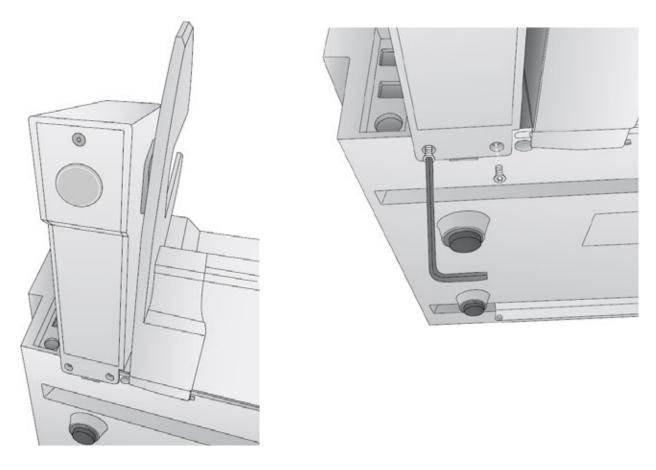

- 5. Slide the Roll Holder to the far right.
- 6. Locate the remaining roll holder with the protruding wire. Connect the wire to the port on the printer. Tuck the wire inside the cavity.

7. Snap the holder in place so the two screw holes line up with the holes on the printer.

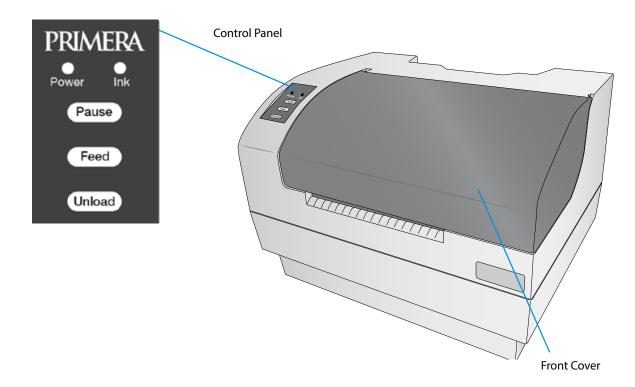

- 8. Install the T8 screws using the INCLUDED Allen key or a Torx T8 screwdriver.
- 9. Rotate the printer back on its feet.

1D Identifying the Parts

These illustration shows the printer from various angles so all important parts can be identified.

The **Power LED** indicates that the printer is on and ready to receive print jobs.

The Ink LED will illuminate when a cartridge has 10% or less of its ink remaining.

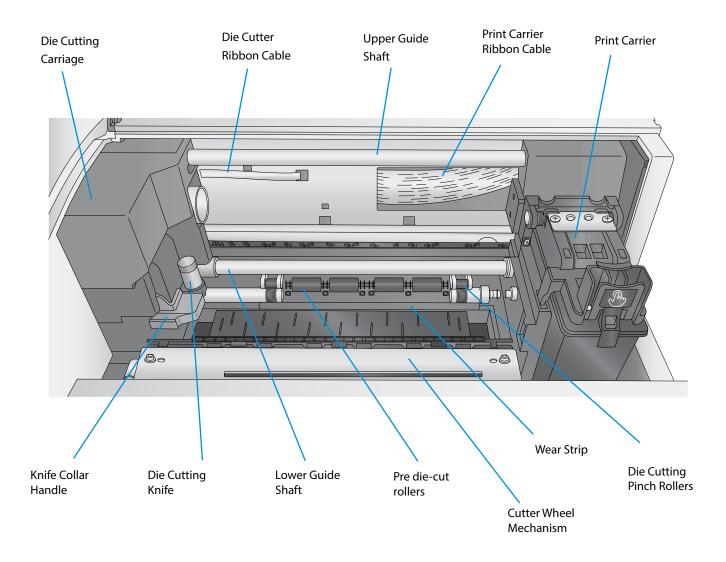

The **Pause Button** is pressed to pause a job to allow for loading of label stock and ink cartridges. The printer pauses after the printing of the current label has finished.

The **Feed Button** is pressed in order to load label stock if the printer does not automatically detect the stock. When stock is loaded each press of the button will cause one label or a few inches to be fed through the printer.

The **Unload Button** is pressed to unload label stock after you receive an End of Roll message in PrintHub. The printer will reverse the label stock through the feed area.

Back

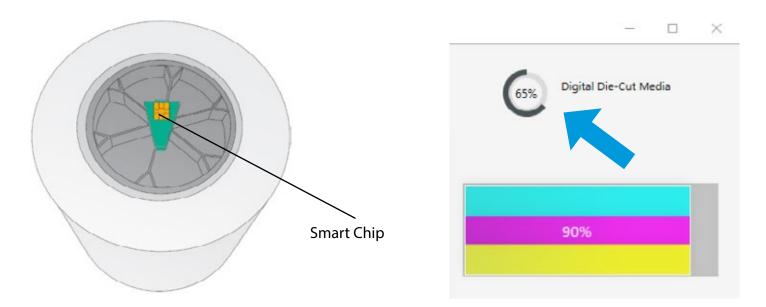

Section 2: Media, Cartridges and Knives

2A Label and Roll Specifications

Two types of media can be used.

Digital Die-Cut Labels. If you are using the printer to digitally die-cut your own shapes and sizes only DTM genuine label stock can be used. This media comes from DTM print with a smart chip that identifies the media, tracks the percentage remaining and automatically sets the sensor type to continuous. You will know it is installed when you see the Digital Die-cut Media percentage in the upper right corner of PrintHub. If you do not see this indication, the digital die cutter will not be enabled and you will not be able to cut shapes.

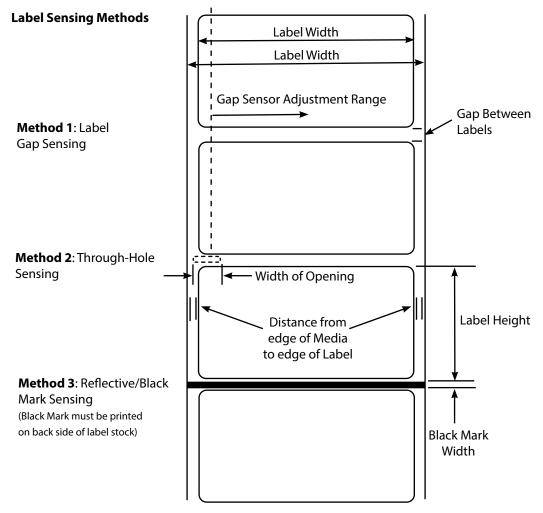

Other media cannot be used even if you take the chip from new/old DTM media for the following reasons:

- Old chips cannot be reused once they reach 0% remaining.
- Other media has liner that may be too thin. Liner on DTM media is specially created for our printer to prevent cut through to the wear strip
- The dust created from cutting through the inkjet printable topcoat can be excessive on some media. This can cause frequent print cartridge clogging and other problems.

Pre Die-Cut Labels. A wide variety of pre die-cut label stock can be used in the printer. Refer to the specifications and settings in the following sections before ordering custom stock from Primera or any stock from another company.

Important! Test all custom made label stock with the intended printer before ordering large quantities! Primera will only assume responsibility for custom label stock ordered from DTM/Primera or Primera ASIA.

Note: See table below for Max and Min values in inches and mm.

	Max	Min
Label width	127 mm (5″)	13 mm (0.5″)
Liner/media width	130.17 mm (5.125")	54 mm (2.125")
Label height/length	305 mm (12")	13 mm (0.5″)
Gap between labels	253 mm (10″)	2.5 mm (0.10″)
Width of through-hole	12.65 mm (0.5″)	6.325 mm (0.25″)
Gap Sensor Adjustment	52 mm (2.05″)	10.16 mm (0.40")
Reflective/Black Mark Width*	N/A	2.54 mm (0.1″)
Max Outer Diameter (OD)	152.4 mm (6.0″)	N/A
Inner Core Diameter (ID)	76.2 mm (3.0″)	76.2 mm (3.0″)
Recommended Total Thickness(Liner + Label)**	10 mil (.0010″)	
Distance from edge of media to edge of label	Printer assumes 2 mm (1/16") gap.	This is adjustable via the left margin offset.

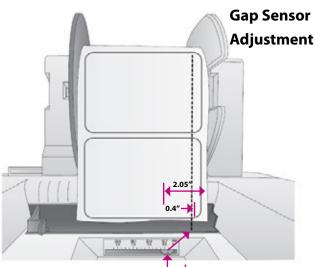

* The Reflective/Black Mark should be opaque to infrared light. The mark should be between the labels. The end of the mark should correspond with the beginning of the label.

** This is the recommended maximum. There are two factors that determine whether the printer will accept any particular stock thickness.

- 1. The ability for the printer to pull the paper through the print area.
- 2. The ability for the sensor to read through the backing if the sensor is set to die-cut.

If you are printing in continuous or reflective label sensing mode number 2 does not apply. The fact that the printer must read through the backing in die-cut mode will limit the thickness much more than the printer's ability to pull the paper through the print area. However, if you adjust opacity level of the liner enough to allow the label to be seen by the stock sensor, the thickness will only be limited by the printer's ability to pull it through the printer area. For these reasons the weight or thickness of the liner is a variable that cannot easily be defined. Primera recommends and uses 40# liner with all Pre Die-Cut label stock.

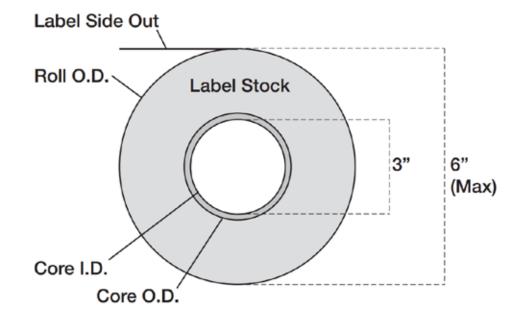

It is important to test all label stock with the intended printer before ordering large quantities!

Gap Sensor Position Indicator from right edge of media. The position indicator corresponds to the ruler NOT the installed label stock.

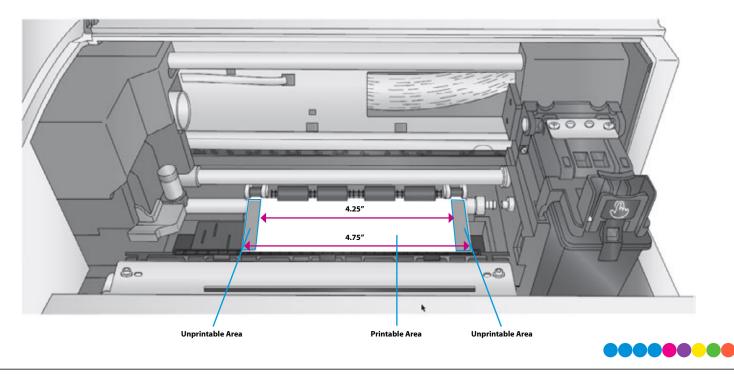

Roll specifications:

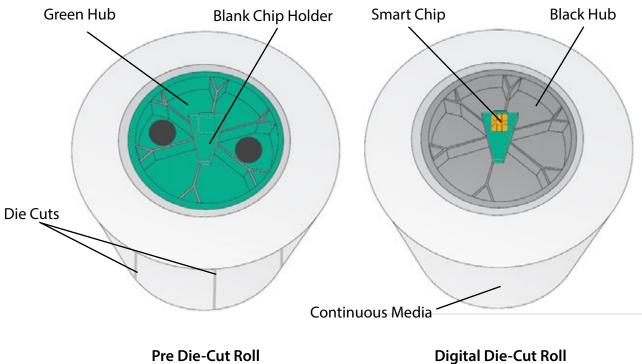

Note on Label Orientation: If you are using an applicator to apply your labels, be sure to order label stock with the correct orientation for your applicator. For example, most applicators will apply the side of the label first, so you will want to print the labels sideways.

Digital Die Cut Media Notes: Even though the width of the media is 4.75 inches, the drive rollers on either side prevent printing in the areas indicated. The knurled rollers that bite into the media to drive it, damage the printable surface in this area. The actual printable area is 4.25 inches.

2B Installing Digital Die-Cutting Label Stock

Digital Die-Cut Labels. If you are using the printer to <u>digitally die-cut your own shapes</u> and sizes <u>only DTM</u> <u>label stock can be used</u>. This media comes from Primera with a smart chip that identifies the media, tracks the percentage remaining and automatically sets the sensor type to continuous. You will know it is installed when you see the Digital Die-cut Media percentage in the upper right corner of PrintHub. If you do not see this indication, the digital die cutter will not be enabled and you will not be able to cut shapes.

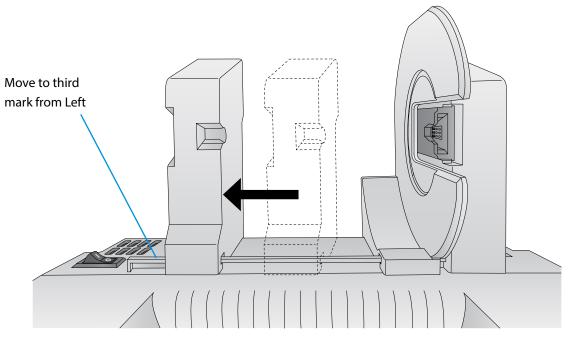

(User must install Green Hub)

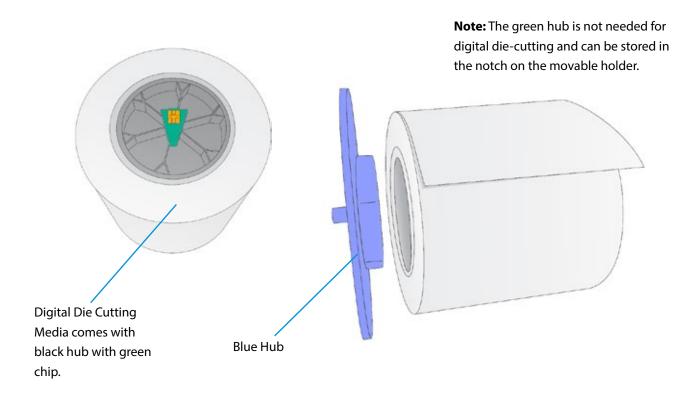

(Hub/Chip comes preinstalled)

 Move the roll holder to the preset position for on demand digital die-cutting (3rd mark from the left – 1.25")

2. Install the Blue Hub on the open side of the digital die-cutting media.

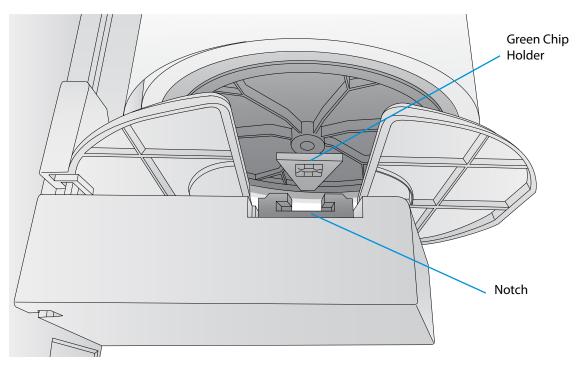

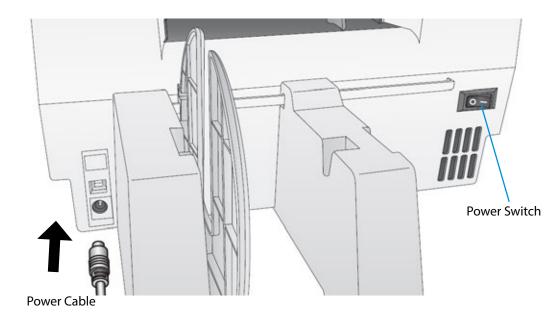

3. Set the roll in place so that the blue pin sits in the notch on the roll holder.

4. Make sure the green chip holder fits in the corresponding green slot on the roll holder.

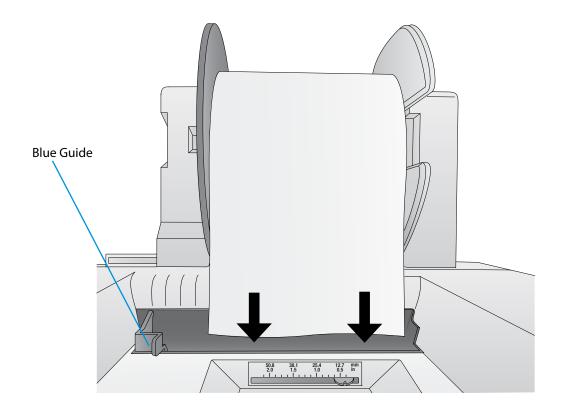

5. Before feeding the stock you must plug in power and switch on the printer.

6. Guide the leading edge of the roll into the feed area. Move the blue guide to the far side.

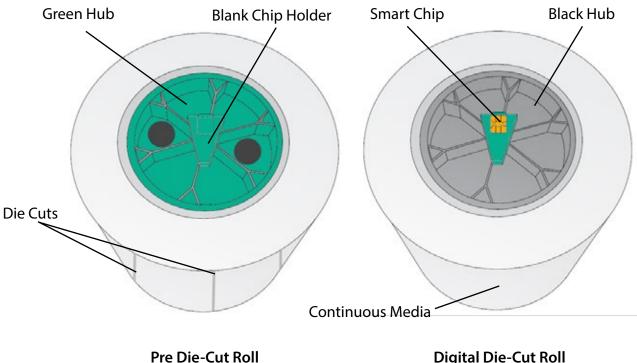

7. Push until the printer detects the stock, grabs it and pulls it through the printer.

2C Installing Pre Die-Cut Label Stock

Digital Die-Cut Labels. A wide variety of pre die-cut label stock can be used in the printer. This media has the shape already cut on the roll before you load it into the printer. The plotter cutter is not used for this label stock. These are available from Primera or other companies.

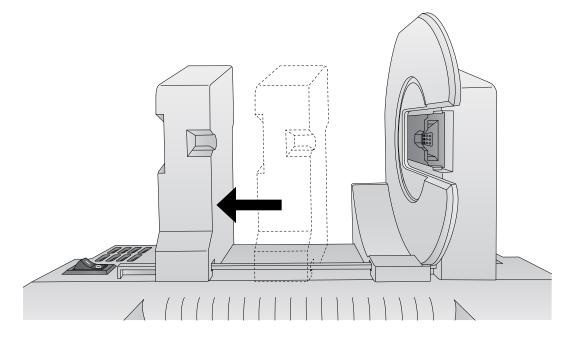

Pre Die-Cut Roll (User must install Green Hub)

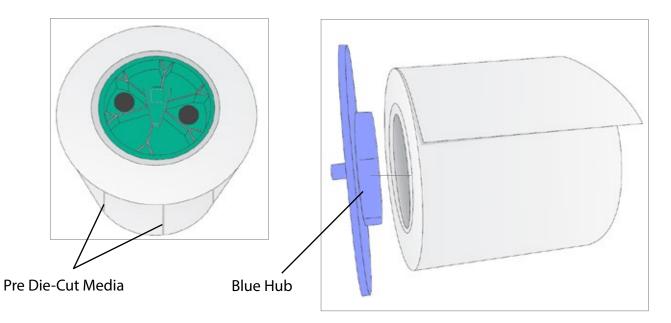

Digital Die-Cut Roll (Hub/Chip comes preinstalled)

1. Move the roll holder to the approximate position which matches the width of the stock you are installing. You can always fine tune this later.

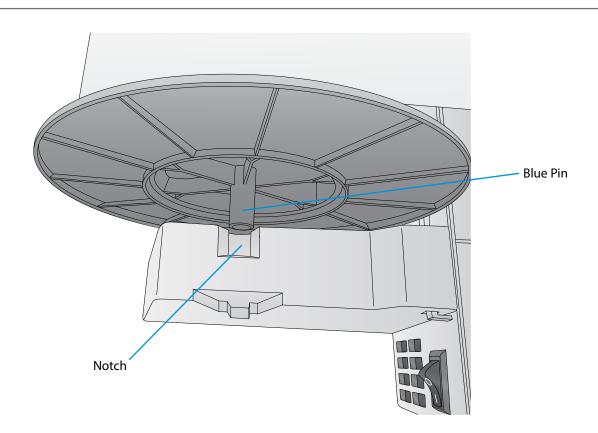

- 2. Install the Green Hub on the right side of the pre die-cut media.
- 3. Install the Blue Hub on the left side of the digital die cutting media.

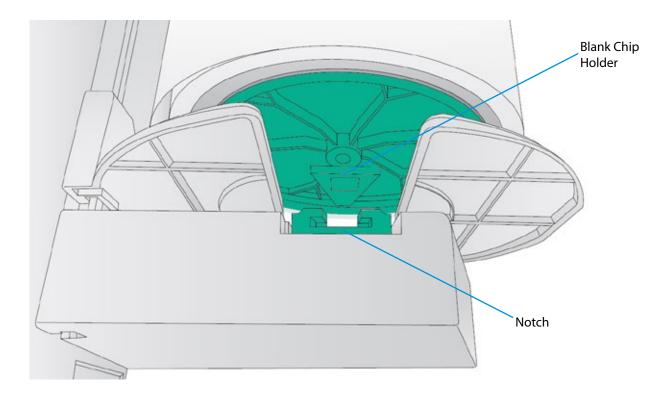

4. Set the roll in place so that the blue pin sits in the notch on the roll holder.

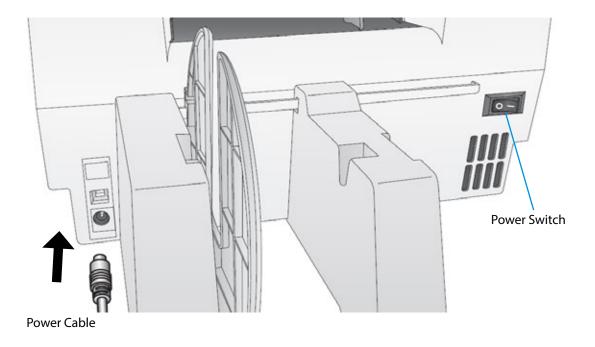

5. Make sure the green blank chip holder fits in the corresponding green slot on the roll holder.

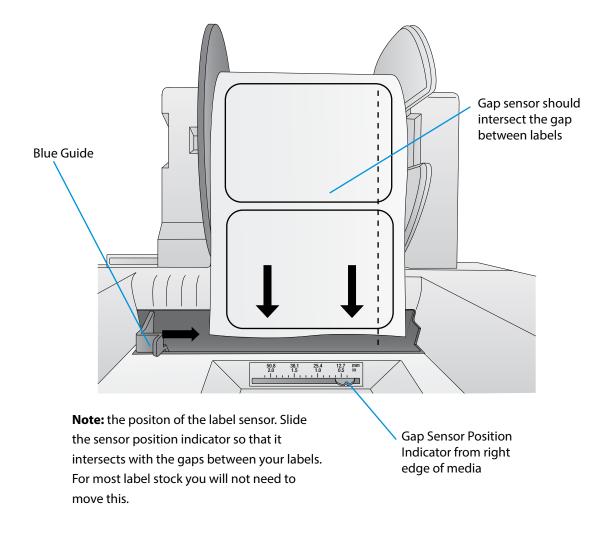

Before feeding the stock you must plug in power and switch on the printer.

6. Guide the leading edge of the roll into the feed area. Move the blue guide so that it touches the label stock.

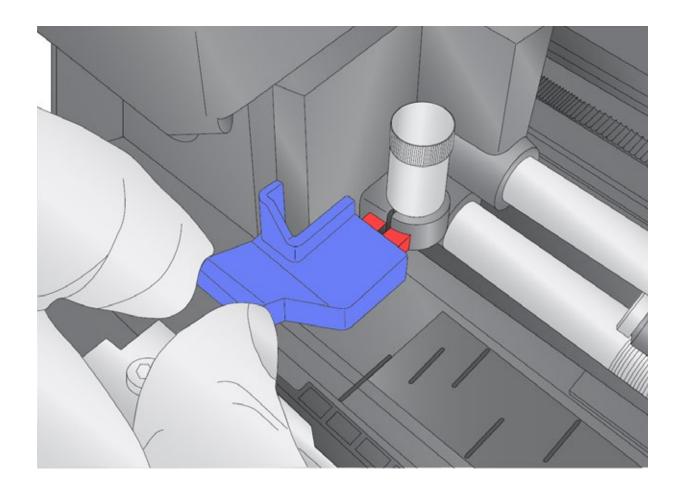

7. Push until the printer detects the stock, grabs it and pulls it through the printer.

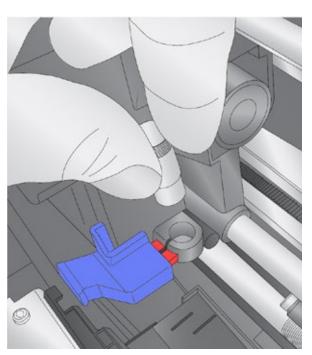

2D Replacing the Digital Die Cutting Knife holder

Install the included die cutting knife shown here.

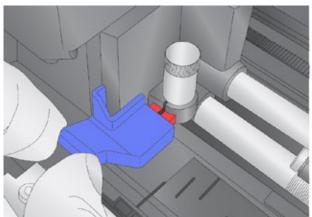

- 1. Open the Cover
- 2. Pull out on the blue handle to loosen the knife collar.

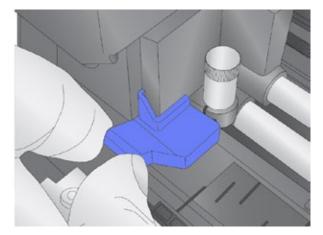

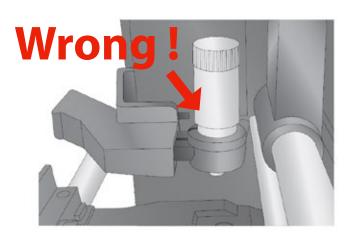

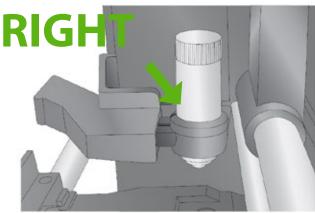

- 3. Install the knife holder.
- 4. Push on the knife so it goes all the way down before pushing the collar in.
- 5. Push the collar to tighten the knife holder and allow it to cut.

Knife Holder

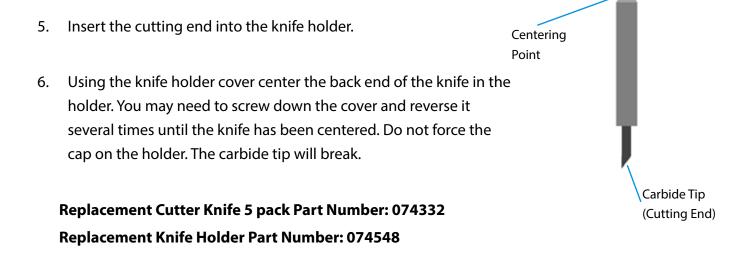

2E Replacing the Cutting Knife

When a knife is dull it will no longer cut through the label at maximum pressure. You will start to see ragged cuts or cuts that do not cut all the way through the label material. You can attempt to increase the pressure but you'll probably need to replace the knife.

If a knife cuts through the liner and contacts the wear strip it may break the tip of the knife. This can be seen under 10x magnification using a loupe or magnifying glass. If the tip is broken the knife must be replaced.

If your knife needs replacement, follow this procedure:

- 1. Remove the knife holder from the carrier using the instructions from section 2D.
- 2. Rotate the cap of the knife holder counter clockwise.
- 3. Remove the knife from the holder. You can tap the holder on a hard surface to free the knife from the holder.
- 4. Locate a new knife. Remove the molded plastic cover from the knife. The plastic cap covers the cutting end of the knife. However, both sides are sharp! The cutting end has an angled carbide tip. The top end comes to a point so it can be easily centered in the receiving divot on the knife holder cap.

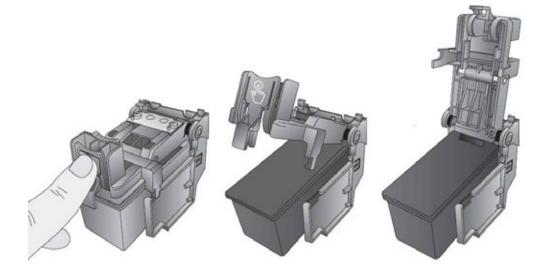

2F Replacing Ink Cartridges

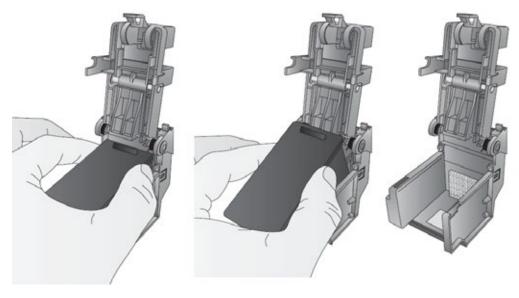

You can replace cartridges at any time or wait for the Low Ink Warning to prompt you to replace cartridges. You will receive low ink warnings at 10% and 0%. Press the Load/Feed button to continue printing after you receive this warning.

To change a cartridge, follow this procedure:

- 1. Open the front cover. That cartridge will automatically move to the right side if it is not already there.
- 2. Press or pinch the tab on the front of the cartridge holder.

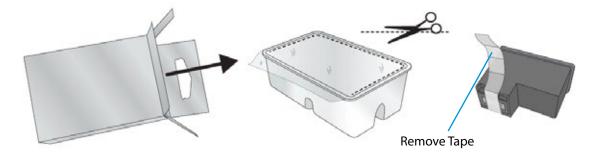

3. Remove the cartridge.

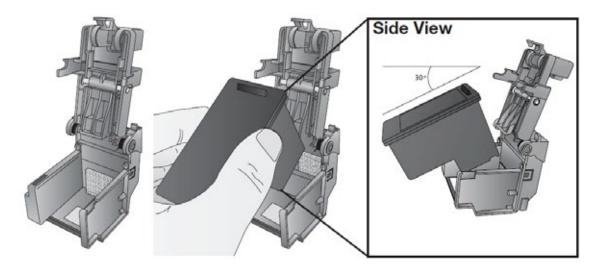

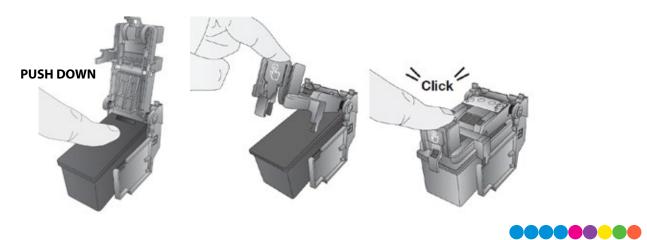

4. Locate a new cartridge and remove it from its packaging. Remove the foil outer package and the tape covering the nozzles.

5. Place the new cartridge into the empty carriage. Note: When installing the cartridge, tilt the cartridge at a slight backward angle of approximately 30 degrees.

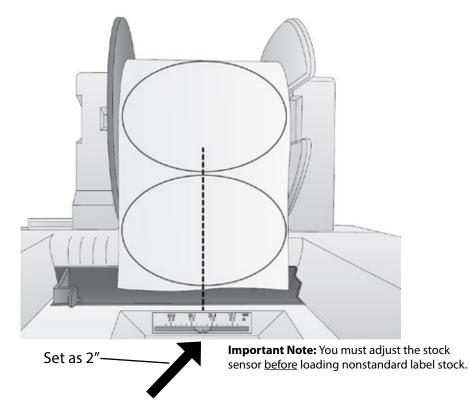

6. Make sure the cartridge is pushed back far enough so the ridge on the cartridge is behind the spring-loaded pusher on the lid. <u>Push down on the cartridge</u>. Close the lid on the cartridge by lightly pressing down from the top until you hear a click.

2G Adjusting the Gap Sensor Position (Pre Die-Cut Labels Only)

If you are using label stock other than standard square / rectangular die-cut labels such as circular die-cut labels or through-hole stock use the instructions below to adjust the position of the label stock gap sensor. The sensor can be adjusted using the slide bar on the back of the printer. Below the slide bar is a measurement which represents the distance between the edge of the label stock and the sensor. Measure the distance from the edge of the label stock to the correct position on the stock. Set the sensor so the side of the slide bar lines up to this measurement. See dashed line in the illustration below.

Circular Labels

If you are using Circular Labels you must adjust the stock sensor to correspond with the very top of the label where the circles are closest together. If the sensor is too far to the right or the left the printer will still sense the label but the image may be offset downward because the printer will start printing at the wrong position. If you are using stock that has multiple labels across, make sure the sensor corresponds to a place on the stock that has a label and not a vertical gap

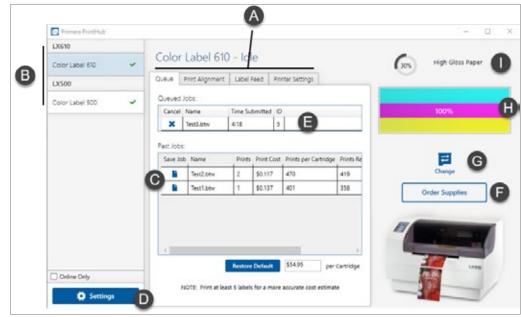

The sensor can only be moved a maximum of 2 inches from the left side of the printable area. This means that the maximum diameter circular label that can be printed is 4 inches. For circular labels larger than 4 inches in diameter, you must have a black mark printed on the back of the label stock. This means that you must change the Stock Sensor Mode to Reflective. The printer will now look for the black mark representing the beginning of the next label instead of the die-cut. For more information on changing the Stock Sensor Mode see section 3C.

Section 3: Primera PrintHub

Primera PrintHub is used to interact with the printer for gathering ink levels, maintenance, alignment, cost calculation and several other functions. You can use it to manage these functions on multiple LX610 printers and other Primera label printer models. PrintHub automatically installs with your printer driver and can be accessed through the printer driver preferences or as a program on your Windows start menu.

1. Connect the printer via USB and turn on the power. The PrintHub accesses most of the information it uses from the printer itself so the printer must be turned on and communicating for the program to be useful.

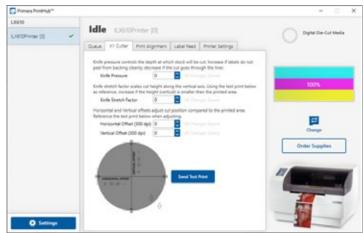

2. Go to Start - Programs - Primera Technology - Primera PrintHub.

- a. Adjust alignment, sensor mode, output mode and advanced settings.
- b. If you have multiple Primera printers connected, they will be listed here.
- c. Past jobs will show the last 5 jobs along with cost information. Click the document icon to view a cost report.
- d. Application Settings
- e. Print Queue shows the currently printing job
- f. Order Link
- g. Frequent Activities
- h. Current Ink Levels (Ink is displayed in 10% increments. Example 100% to 90% to 80% etc.)
- i. Digital Die Cutting Media Status and Remaining Amount (If installed)

3A XY Cutter Settings – Cut Offsets, Knife Pressure and Stretch Factor

Cut Offsets, Knife Pressure and Stretch Factor settings can be found in Primera Print Hub on the XY Cutter Tab.

Cut Offsets If your cut does not line up with your printed image, you can adjust it using the **Horizontal Offset** and **Vertical Offset** settings. Press the Send Test Print to help you determine which direction to move the offsets or refer to the image below.

Knife Pressure affects how deep into the media the knife will cut. Ideally you want to cut deep enough to cut through the label layer on the top but not so deep that you cut through the backing paper (liner). When you cut through the backing paper your label will not peel cleaning off the backing paper. You will also score the wear strip under the cutting knife which can cause the knife tip to break. You will also need to replace the wear strip more often if you cut too deep.

By default, the cutter is calibrated to work with High Gloss Paper Media. However, other media types will need more or less cut pressure to cut properly.

Each roll of media will have a recommended value to add or subtract from the default baseline values used for Knife Pressure and Knife Stretch Factor. These values are listed below and printed on a label attached to the inside of the core.

	Knife Pressure	Stretch Factor
High Gloss Paper	0	0
High Gloss BOPP	4	0
Magnetic	22	32

Knife Stretch Factor can be increased or decreased to compensate for different feed thicknesses and textures of media. Thickness and texture can affect the feed speed of the media usually causing it to feed more slowly than the baseline media (High Gloss Paper). This will cause the height/length of your cut to be shorter. If you find that your cut height/length is longer or shorter than the height specified in the PTCreate software, you may need to increase or decrease the stretch factor. Increasing this value with create a longer cut. Decreasing it will create a shorter cut.

Adjusting Knife Pressure over time. Eventually, the knife blade will begin to wear and require more cut pressure to cut at the same depth as when it was brand new and sharper. Therefore, you may need to add cut pressure when cutting any media even the High Gloss Paper.

To determine if cut pressure should be increased or decreased, follow these steps.

- 1.Print and cut 1 copy and then attempt to peel the label from the liner.
- 2.Check for tear. If the label tears when you remove it, you will need to increase the cut pressure. Increase pressure in small increments to avoid over compensating and cutting through the liner.
- 3. Check the liner. Once you peel up the label, check the liner. If it has been cut through, decrease pressure.
- 4. Continue increasing or decreasing pressure until the label no longer tears when removed or the liner is not cut through.

Note about Magnetic Media. The recommended starting knife pressure for the magnetic media is 22. This media is not meant to be cut all the way through because there is no liner. Instead, this knife pressure setting is meant to score the magnetic media so that it can be removed by hand after printing. In some cases, it may be necessary to tear the outer excess material from the intended shape.

If you do cut all the way through this media, it can damage the wear strip, break the knife tip or cause media jams.

3B Using the Cost Estimator

The cost estimator is found under the queue section on the first tab of the PrintHub. The last five job costs are stored in the list. Each job will show the cost per label based on the cost per cartridge entered below the list. Enter the actual cost of the cartridge you paid. Prints remaining on the currently installed cartridge and total prints on new cartridge are both displayed.

3C Set the Gap Sensor Mode (Pre Die-Cut Labels Only)

The stock sensor mode refers to the method the printer will use to detect the print starting position for each label. To adjust the stock sensor mode, open the PrintHub. In most cases you will NOT need to change this setting. By default, it is set to sense standard Pre die-cut labels. It is only necessary to change this setting if you are using clear labels or any label with a black sensing mark on the back. When you install Digital Die-Cutting Label Stock this setting will automatically be set for you.

- 1. Connect the printer via USB and turn on the power. The Stock Sensor Mode setting is stored in the printer's internal memory so you will not be able to access it unless the printer is turned on and properly communicating with the computer.
- 2. Go to Start Programs Primera Technology Primera PrintHub.
- 3. Click on the Label Feed (3rd tab from left).
- 4. Select the Stock Sensor Mode by clicking on the graphic that most closely corresponds to the stock you intend to install.
- 5. Load the label stock after you have set the sensor mode

There are three sensor modes:

Die-Cut (Default). If you are using standard die-cut labels that look similar to the graphic, use this setting regardless of the size of the label. Also, use this setting for Through-hole label material where a hole is punched through each label or a notch is cut in the side.

Reflective. Use Reflective for label material where a black pre-printed line (black mark) on the back of the label stock indicates the break between labels. Black marks are required on clear label stock rolls, or label where the label waste matrix (waste) is left on the liner. Black marks can also be used for irregular shaped labels, circles larger than 4 inches or on any stock where the print starting position cannot be sensed using the label itself.

Continuous. (Sensor off) If you have continuous stock with no die-cut, reflective mark or holes, set the sensor type to Continuous. This will turn off the stock sensor. In this mode there is no way to set the print starting position. The printer will simply start printing the first label and print each subsequent label immediately after that previous one. To produce a gap between prints simply add the desired amount of white space to the end of the label being printed. The printer will automatically switch to this setting when Digital Die Cutting Label Stock is installed.

Important Note: You must also set the Stock Sensor Position (Section 2G)

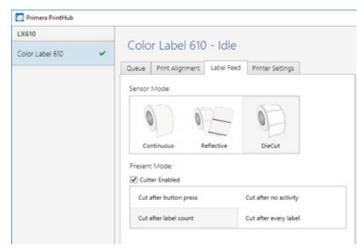

3D Set the Present/Cut Mode

Use the Present/Cut Mode to adjust how the printer presents labels after they are printed or if/when they are cut after printing. To adjust the Present/Cut Mode, open the PrintHub program.

- 1. Connect the printer via USB and turn on the power. The Output/Cut Mode Setting is stored on the printer main board so you will not be able to access it unless the printer is turned on and properly communicating with the computer.
- 2. Go to Start Programs Primera Technology Primera PrintHub.
- 3. Click on the Label Feed Tab.
- 4. Click on the Output/Cut Mode button. There are different options available which change if the Cutter is enabled or disabled. If the Cutter is disabled, the label present options will be available. If the Cutter is enabled the present options are no longer available but cut options become available.

Cutter Options

Cut after button press. This setting will cut after you press the Load/Feed button on the printer. This can be used after one label or an entire job. This feature is useful if you will not be present at the end of the print to catch the cut label.

Cut after label count. This option will cut after the number of labels specified in the toggle box that appears when this option is selected. This is useful if you have front/back labels or sets of labels.

Cut after no activity. This setting will cut at the end of a print job if the printer does not receive another print job within one second of the last print job in the queue. You can use this feature to cut at the end of multi-copy job, multi-page job or multiple individual jobs in the queue.

Cut every label. This setting will cut after every label.

3E Adjusting Print Alignment

If your previous experience with printing is limited to printing letters and cards to 8.5 inch by 11 inch paper you probably are not familiar with an essential part of a label printing - Print Alignment. Standard printers feed a sheet and start printing based on the start of the sheet. They also prohibit printing to the edge of the sheet. This is to avoid any need for alignment.

The LX610 senses the beginning of the label with an optical sensor and is capable of printing to top, bottom, left and right edge. Because of this it is necessary to align the printer to work with specific types of label stock.

The LX610 comes factory calibrated to print exactly to the edge of Primera label stock. However, due to variations in the left margins and other variables it may be necessary to fine tune these settings at the beginning of each roll. This is especially true for other non-Primera brand label stock.

Adjust print alignment using the PrintHub. Go to the Print Alignment Tab (second tab).

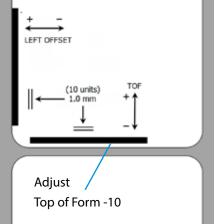

ican Edges			
idge scan skip count	4	0	

Click More Settings to adjust the edge scan. By default the printer will scan for the edge of the media to determine the horizontal start position. Some media may not produce consistent scan result. In those cases you can uncheck the Scan Edges box. By default, the printer will scan for the horizontal start position ever 4 labels. Increase/Decrease the Edge scan skip count to change the frequency of the scan.

Click on Test Alignment to print the alignment shown to the right. Look at the print to determine how much white space is visible on the edges. The black lines should print right on the leading edge and left edge. In this example the Top of Form needs approximately - 10.

1. Left Margin Offset. This value moves the printed label left or right. Add to the current value to move the printed label to the right. Subtract from the current value to move the printed label to the left.

2. Top of Form (TOF). This value moves the print start position up or down on the label. Add to the current value to move

the printed label down or toward the printer. Subtract from the current value to move the printed label up or away from the printer. The value is automatically saved as soon as you set it. You may have to make several adjustments to one or more of these values. After each adjustment you can click the Test Alignment button to print a small test pattern on the label. This will help you find the proper alignment value.

3. Tear off/Cut Position. This value adjusts the position of the last label printed after it has been presented. This only applies if the output mode is set to "Present the label." Add to the current value to move the tear point closer to the printer. Subtract from the current value to move the tear point away from the printer. The value is automatically saved as soon as you set it.

3F PrintHub Settings

General application settings that apply to the software and all printers can be found by clicking the blue "Settings" button in the lower left. Printer specific settings can be found on the "Printer Settings" Tab. See next section.

Language. Typically, the language is set to match the language setting in the operating system. However, you can override currency settings on the Language Tab.

Automatic Updates. Automatic Updates will update PrintHub, the printer driver and the printer firmware. Every 7 days you will be prompted to update the software if there are any newer versions. You can choose to increase or decrease that automate check. You can also perform a check for updates immediately by clicking the "Check for Updates" button. Finally, if you would like to receive beta software check the "Check for Beta updates" box

Primera PrintHub			- 🗆 🛛
LX610		Color Label 610 - Idle	
Color Label 610	× -

		Days between auto-check for updates Oheck for Beta updates	
		Check for Updates	t. Clean
		Order Parts Or 0.0 Tear Off Position	
Online Only	_	Test Alignment	1
Settings		More Settings	

Printing Preferences. You can choose to close PrintHub after printing completes by checking the "Close this application after printing completes" box. PrintHub automatically opens whenever you send a print job to the printer. If you do not want PrintHub to open in front of other programs, you can check the "Launch minimized during print" option.

Support. Click the "Generate Support Report" button to generate a zip file on your desktop containing all recent log files. Send this to tech support so they can help solve any printing problems.

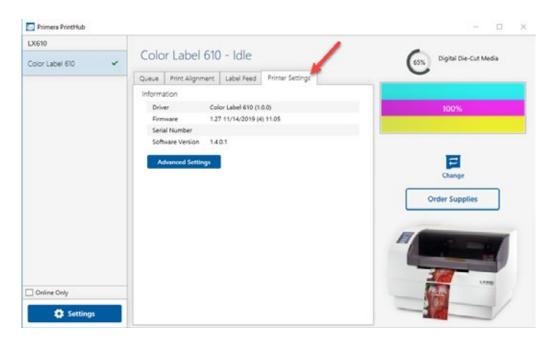

Advanced. Check the "Generate Printer Status XML" box to create an XML at "C:\ProgramData\PTI\PrintHub\PrinterStatus.xml".

Software developers can use this file to display status information such as error messages and ink levels in 3rd party applications.

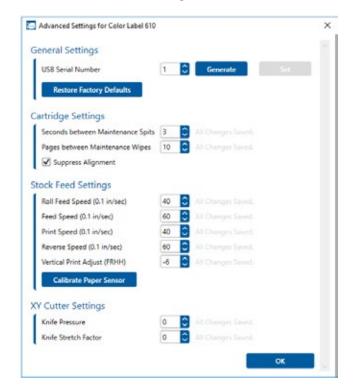

3G PrintHub Printer Settings

Printer settings can be found in Primera Print Hub on the Printer Settings Tab for the LX610e.

Information. This section displays all current driver, software and firmware versions.

Advanced Setting Button. Click the Advanced Settings button to view the following settings.

3G.1 Multiple Printer Support

You can install multiple printers to the same computer and use them simultaneously. To do so you will need to change the USB serial number identifier of one of the two printers, two of three printers, three of four printers etc. To change serial numbers:

- 1. Connect each new printer one at a time. The current USB Serial Number will be displayed.
- 2. Click Generate. It will find the next available USB Serial Number based on the currently connected printers. For the first one it should set it to 2 and for the next printer 3 and so on.
- 3. Click Set. You will hear the printer reset and the settings window will turn gray. After it resets you will be able to see the settings window again. Keep the printer connected.
- 4. Now you can connect the next printer. Windows will automatically install a new driver for that new printer and name it Color Label 610 (Copy 1). You can rename it later by editing the printer properties in the Windows printer list.
- 5. You will now see a second printer appear in the left column Color Label 610 (Copy 1). Click on it to display information about this printer. If this is the last printer, you will connect you are done. If you wish to connect additional printers follow through steps 2-4.

Restore Factory Defaults. This will set all Print alignment and other calibration settings back to factory defaults.

Cartridge Settings. Here you can adjust the frequency of certain maintenance operations. Increasing the value of "Seconds between Maintenance Spits" will decrease ink usage but could also cause poor quality printing.

Increasing or Pages between Maintenance Wipes will speed up printing but could also cause poor quality printing.

Check the Suppress Alignment message to prevent the window from appearing which prompts you to align the cartridge every time a new cartridge is installed. Skipping the alignment is faster but can result in poor print quality.

Stock Feed Settings.

Adjust these settings only if directed to do so by Tech Support.

Calibrate the paper sensor if you are receiving TOF errors. The calibration process will prompt you to remove all paper/stock from the printer before calibrating.

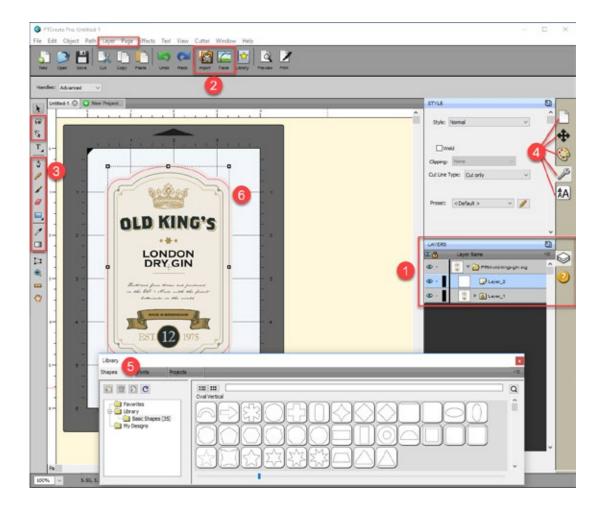

Section 4: Printing and Cutting with PTCreate

PTCreate is everything you will need to layout your prints and cuts for your LX610. Every object that you place in your layout, can be set to print only, cut only or Print and Cut. There are two different versions. The Standard version comes with the printer. The Professional version can be purchased. After a 30-day trial the Professional version requires an activation code. During the trial you can use the program but you are not able to save files or send cut files to the printer.

Mac Note: Only the Pro version is available for Mac users. The following screen captures are from the PC software. However, all Pro version features are the same on Mac and PC. Locations and functions are the same on Mac and PC.

4A Overview

- 1. Layers. (not in Standard Version) Layers allows you to see and manipulate layers of imported SVG files or elements added within PTCreate. SVG files can be created in programs like Adobe Illustrator.
- 2. Import and Trace. Import allows you to flat files and vector files (not in Standard Version) which can be a graphic you would like to print, a cut file or both in the same file. Trace allows you to create a cut file be tracing a JPG, BMP or TIF or other flat file that you have imported. This is a great option for creating complex cut files without needing another expensive and complex design program.
- **3.** Advanced Design Tools. (not in Standard Version) Advanced design tools such as Gradient, Eye Dropper, Eraser, Freehand drawing and the Shape Node Tool allow you to create your own design in PTCreate.
- 4. Document, Position and Size, Fill and Stroke, Style, Text. These tabs all manipulate existing objects on the page. Document controls the artboard or page size. Position and size allow you to precisely move objects on the page. Fill and stroke allows you to change the color of lines. Style allows you to change whether a particular object should be cut, printed or both. Text allows you the change font and size of text objects.

POSITION & SIZE	N	DOCUMENT	
X: 0.000 in Y: 0.000 in Nudge: ▲ ▲ ▲ H Align: ▲ ▲ ■ V Align: ■ ▲ ■ To Page		Page Size: Custom Size Orientation: Vertical (Portrait) Units: Inches Show Grid Grid Lines: 6.00 in •	- (****)
W: 2.125 in 🔹 H: 2.125 in 🔹 Keep Proportions Rotate: 📑 🛄 Flip: 🕅 🕁	A A - ?	Subdivision: 6 Edit Subdivision: 6 100 Show Guidelines Workspace Alpha: 100 Show Outlines Only	

- **a. Document.** Use this tab to adjust the page size after it has already been setup. Sometimes you may need to increase the height the page to accommodate a bleed or multiple rows.
- **b. Position and Size.** You will use this tab to move both the cut line and the image on the page. It is much easier than trying to drag and drop images manually.

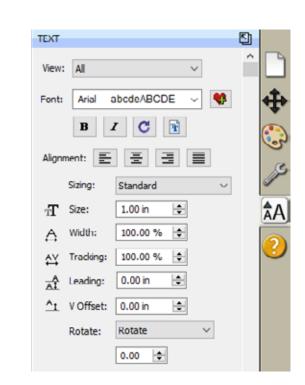

FILL & STR	IOKE		STYLE	5
Fill: Opacity:	None ~		Style: Normal 🗸	
Stroke: Opacity:	Color	y (2)	Weld Clipping: None V	
Width:	1.00		Cut Line Type: Cut only Print only	
Join: Miter:		ÂA ⊘	Cut only Print & Cut	≜ A
End Cap:				2
Line Style:	V Edit			1

- c. Fill and Stroke. Use this to change the line style of the cut. For the most part you should leave these settings at their defaults. If you are having trouble seeing your cut line, you can change the color of it here.
- **d. Style.** Here you can designate whether any object should be Print, Cut or both. By default all images imported using the import icon will be set to Print. Also, all objects drawn using the rectangle or circle tool will be set to Cut. However, this tab will allow you to adjust this if necessary.
- e. Text. The text tab allows you to adjust the font, size and other properties of text. Text can be added using the Text tool from the left side tool bar.

- 5. Library. The library contains some preset shapes that you can apply to your document as cut objects or print objects.
- 6. Page Layout. This area shows your actual image. You can move objects here by clicking and dragging. You can also see where the cut will be made in relation to your print. In the example above the cut line is highlighted red and inset (overbled) slightly so there will unprinted area on the label

4B PTCreate Software Activation

You will need to activate the Pro version of your PTCreate software.

You will be sent an activation code in your purchase confirmation.

To Activate follow the activation prompt that appears when you open the software or go to the Help Menu - Activate

If you are unable to deactivate because of a computer crash, please contact tech support to receive another activation code. If you have the Pro version, please have your order number ready to speed up the process.

4D: Tutorial: How to Setup a Print and Cut using PTCreate Pro – Vector File Cut

If you have a designer that is able to use an advanced program like Adobe Illustrator or Corel Draw, you can save your print file and cut file together as a multi-layer vector file in AI, EPS, or SVG format. You can then import them into PTCreate and designate which layer will be the cut and which will be the print. This will allow you to create complex cuts in exactly the right shape and exactly the right position. This method is the best way to get the highest quality print and cut. While tracing the image using the steps in the previous section will allow you to create the same shapes, you can save time and create a smoother cut file using this method.

Important Note: Before you start with PTCreate, your designer should create the print and cut line togetherand save them as two separate layers in the same file. You'll be able to see these layers when you import the file into PTCreate.

4D.1 Choosing a Label Size (Page Layout)

After you activate your software you will be prompted to open or create a new project.

1. Choose New Project...

Open Project Click "Open Project" to continue working on an existing project.
Recovered Projects Continue working on recovered projects.

2. Set your page size. Since all die cutting media is 4.25" wide the standard maximum width is automatically set to 4.25. In this example we have set the size to 4.25 x 6 to accommodate approximately a 4" x 6" label.

New Project		Tip! Set your page larger / than the label size to be
Name:	Untitled-1	cut. This will allow you to
Page Size:	Custom Size V	create a bleed around the label so that you always cut
w:	1.25" x 1" 4.25" x 2" 4.25" x 3"	inside your print and get
H:	4.25" x 4" 4.25" x 4" 4.25" x 6"	perfect cut every time.
Orientation:	4.25" x 8" 4.25" x 12"	
Units:	Custom Size	
	Cancel OK	

3. To set the page height or width to a custom size type the size in the W: and H: boxes or toggle the size up or down with the arrows.

New Project	
Name:	Untitled 1
Page Size:	Custom Size ∨
w:	4.25 ln
H:	10.000 in 🚖
Orientation:	Vertical (Portrait) \checkmark
Units:	Inches 🗸
	Cancel OK

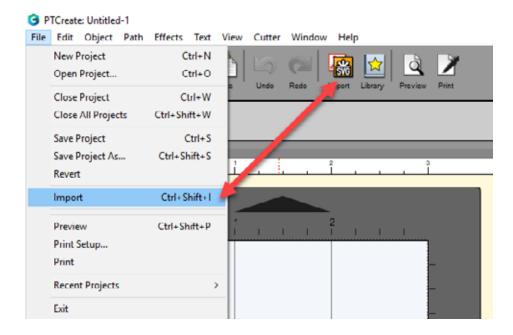

4D.2 Import a flat Image (JPG, BMP, PNG, TIF, GIF)

PTCreate Pro allows you to import vector files for printing and cutting. You can import the following vector image formats: PDF, AI, EPS, SVG

To import an image for printing follow these steps.

1. Go to the File Menu or shortcut bar, choose Import.

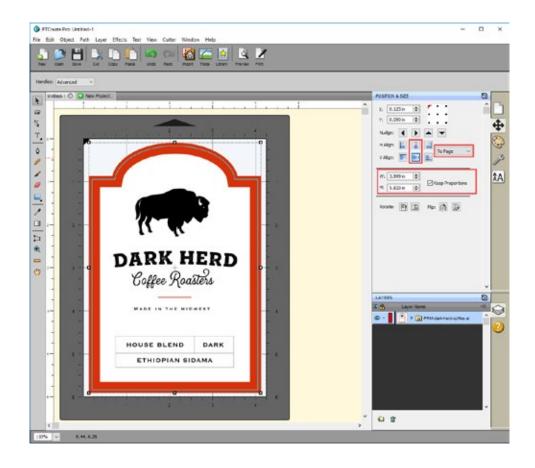

2. Browse to the file you would like to use and choose Open.

Open Look in:	Sample Lal	bels	V G 🛊 😕 🛄+		
Quick access Desktop Libraries This PC	Name Samples PRM-dark Repose_K Repose_K Repose_K	-herd-coffee.ai -herd-coffee-dieline.svg	Date modified 10/11/2019 3:29 PM 9/19/2019 3:29 PM 9/19/2019 3:29 PM 9/19/2019 12:50 PM 9/19/2019 12:52 PM 9/19/2019 2:29 PM 9/19/2019 2:24 PM	Type File folder Adobe Illustra SVG Documer Adobe Illustra SVG Documer SVG Documer	Preview Show Outlines Image: Contract of the second seco
	<			>	
	File name:	PRM-dark-herd-coffee.al	~	Open	
	Files of type:	Al Readable Files	<u> </u>	Cancel	

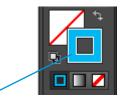

3. The file will appear on your page layout. You can manually move it on your page or increase the size. However, a better option is to use the Position and Size window. Set the size to match the size of the page layout. In this case center the image to the page.

4D.3 Working with Layers in an Imported Vector File

Once you have imported the vector file you view the layers in the layers window. The cut file must separated from the design at the top level. It cannot be buried under other layers that will be printed. In this example the cut line layer is setup in Illustrator as an Outline instead of a Fill. Either will work but Outline is preferable.

- G PTCreate Pro: -File Edit Obj н a 1 3 1 67 ☆ * -际 Т, ٥ I 1 10 ħΑ. 0 ÷. B CA Per CA D 1 D . DARK HERD -0 Coffee Roasters K) IN THE MIDWEST HOUSE BLEND DARK
- 1. To view the sublayers and find the cut line click on the arrow to open up the group.

Click Arrow to open layer groups

Note: Before printing we recommend clicking the print Preview Button described in section 4H

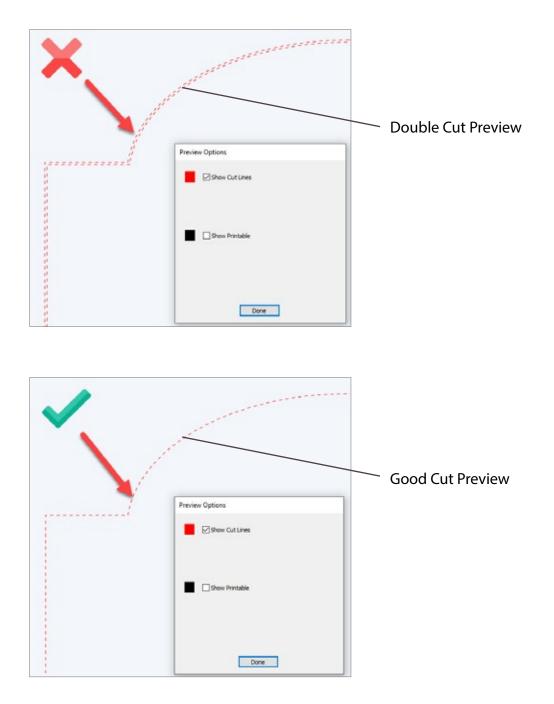

- 2. Once you find the cut line, select that layer and click the style tab above.
 - a. <u>Choose Cut Only!</u>
 - b. <u>Set Style to Blackout.</u>
- 3. Now select the Print layer, click on the stye tab above and choose **Print Only!**

STYLE		STYLE	5

Layer to be Cut		Layer to be Pri	nted

4. To print go to the File Menu and choose Print or click the Print Icon on the shortcut bar. The print dialog will appear. Make sure Print+Cut is selected. Click the Properties button to access the print er settings such as Print Quality, Saturation and Color Matching. For a full explanation of printer driver settings see section 5F.

5. If you do not choose the Blackout option described in step 2 and 3 you may end up with a double cut that will cut through the liner/backing paper of your label. Check for this in the preview.

4E Tutorial: How to Setup a Print and Cut using PTCreate Pro - Contour Cut

This tutorial will walk you through the basic steps to print and cut a label using the trace image / contour cut feature found in the Professional version of PTCreate.

4E.1 Choosing a Label Size (Page Layout)

1. Choose New Project...

	New Project	Click "New Project" to start a new blank project with default settings.		
	Open Project	Click "Open Project" to continue working on an existing project.		
	Recovered Projects	Continue working on recovered projects.		
roje	rte	Clear Rece		

2. Set your page size. Since all die cutting media is 4.25" wide the standard maximum width is automatically set to 4.25. In this example we have set the size to 4.25 x 4.25 to accommodate approximately a 4" x 4" label.

New Project		Tip! Set your page larger than the label
Name:	Untitled 2	size to be cut. This will allow you to create a bleed around the label so that you always
Page Size:	Custom Size	cut inside your print and get perfect cut every time.
w:	4.25 in	
Orientation:	Vertical (Portrait)	
Units:	Inches V	
	Cancel OK	

3. To set the page height or width to a custom size type the size in the W: and H: boxes or toggle the size up or down with the arrows.

New Project	
Name:	Untitled-1
Page Size:	Custom Size \lor
W:	4.25 in 🚖
H:	10.000 in 🚖
Orientation:	Vertical (Portrait) \checkmark
Units:	Inches ~
	Cancel OK

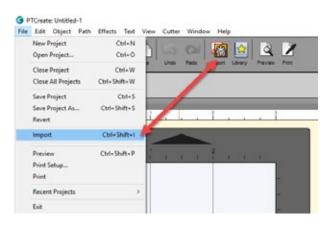

4E.2 Import an Image.

PTCreate Pro allows you to import flat files and vector files. You can import the following image formats: AI, EPS, PDF, SVG, JPG, BMP, PNG, TIF, GIF.

Important Note: Primera recommends imported images are at least 300 DPI. The software is optimized for this size. Larger DPI images can be manually resized. Smaller DPI images will not utilize the maximum quality of the printer and may appear pixelated. Images downloaded from websites are typically made to display only onscreen load quickly so they are typically only 72 DPI.

To import an image for printing follow these steps.

1. Go to the File Menu or shortcut bar, choose Import.

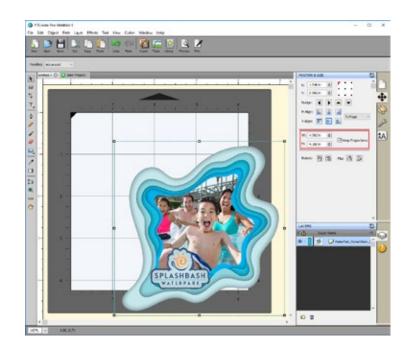

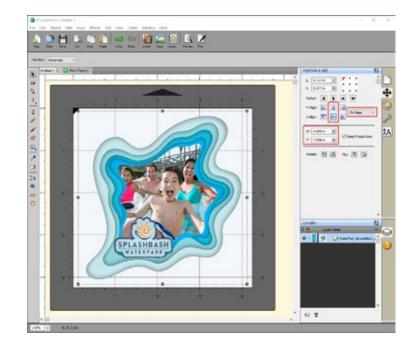

2. Browse to the file you would like to use and choose Open.

Look in:	Label Desi	yns ∨	G 🦸 📂 🗔 🗸

	•			,	

- 3. The file will appear on your page layout.
- 4. You can manually move it on your page or increase the size. However, a better option is to use the Position and Size window. Set the size to match the size of the page layout. In this case set the width to 4" and check the Keep Proportions box.

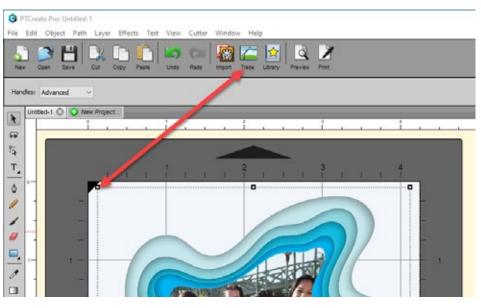

5. Center the image horizontally and vertically to the Page.

4E.3 Trace Image and create Cut Line

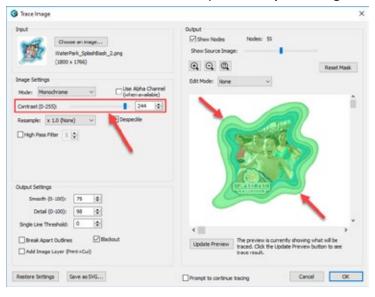

Tracing the images requires a flat file such as BMP, GIF, JPG or PNG.

1. Select the image object that you just imported. This is very important. You'll know it is selected when the bounding box appears around the image. Now click on the Trace Icon.

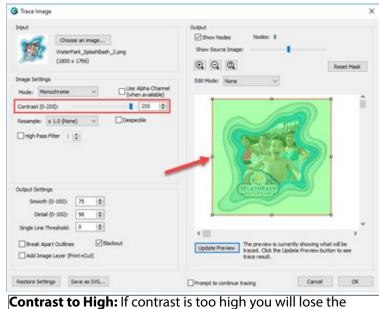

- 2. There are many options available in the Trace Image window. However, the most important option is the Contrast. You should adjust the contrast until the preview shows a single green highlighted image in the shape you would like to cut.
- 3. Click Update Preview to show the cut lines and the number of points/nodes in your cut file (if you check Show Nodes). These nodes are the points on your image to which the knife will travel

to cut the label. Don't worry if your cut line isn't exactly in the right position or size. We'll adjust that later. At this point you are just looking for smooth lines that represent the correct shape.

Trace Image	
Input	Output
Choose an image WaterPark_SplashBach_2.png (1800 x 1766)	Show Source Image:
Image Settings Node: Monochrome V Dise Alpha Channel	Edit Mode: None v
Contrast (0-255): (when available)	Î Î

Break Apart Outlines Blackout	 Lipdate Preview Is currently showing what will be traced. Click the Update Preview button to see trace result.
Restore Settings Save as SVG	Prompt to continue tracing Cancel OK

4. Note the difference in the preview when you increase and decrease the contrast.

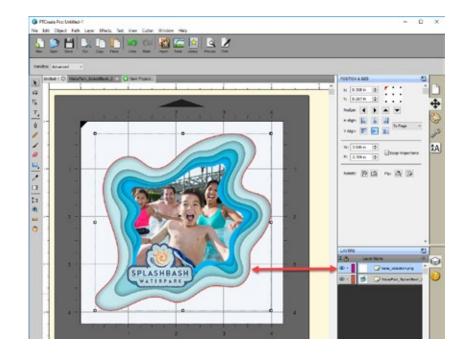

Contrast to High: If contrast is too high you will lose t shape detection and end up with a rectangle cut.

Trace Image		
put Choose an image WaterPark_SplashBash_2.png (1800 x 1766)	Output Show Nodes Nodes: 359 Show Source Image:	task

Smooth (0-100): 75 (- Detail (0-100): 98 (- Snois Line Threshold: 0 (-	a har a cont	
Single Line Threshold: 0 🔹	 Update Preview. The preview is currently showing what will be traced. Click the Update Preview button to see 	>
Add Image Layer (Print+Cut)	trace result.	

Contrast to Low: If contrast is too low you will end up with extra cut lines outside of the main cut and potentially the wrong shape. In this example the cut line is tracing the wrong part of the image.

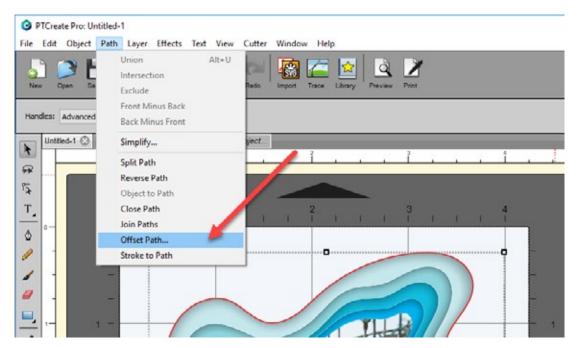

5. Click OK when you are happy with the shape of your cut line. The cut line will appear on top of your image as a red outline. You'll see a trace layer appear in the layer window.

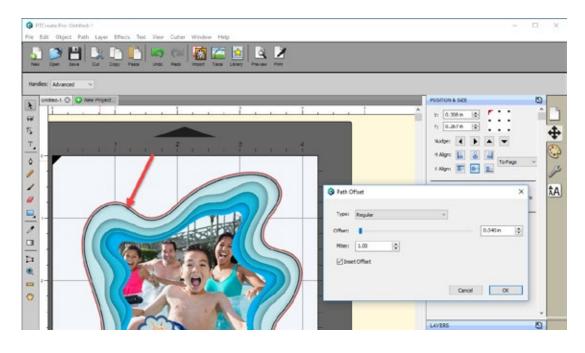

4E.4 Offset a Cut Path

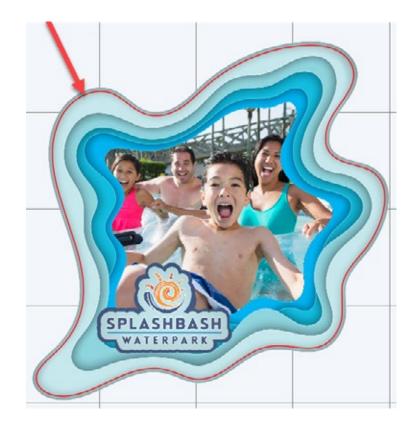

1. Now you'll need to offset the cut line inside your image so that you'll have a bleed. With the cut line selected go to the Path Menu and select Offset.

2. On the Path Offset Window, check the Inset Offset box and adjust the amount of offset. For this image we chose 0.040 inches. You'll see a preview of the new position of the cut line in black.

3. Click OK to change the Offset. The new cut line will appear.

Note: Before printing we recommend clicking the print Preview Button described in section 4H

4. To print go to the File Menu and choose Print or click the Print Icon on the shortcut bar. The print dialog will appear. Make sure Print+Cut is selected. Click the Properties button to access the printer settings such as Print Quality, Saturation and Color Matching. For a full explanation of printer driver settings see section 5F.

4F Setup multiple identical cuts (Duplicate and Array)

If you intend to print and cut a smaller label such a 2" circle you may want to duplicate that image and cut line across the page so that you don't waste material. No matter what your label size is your page size for die cutting is always 4.25". It makes sense to fill up that page with as many labels across as you can. Follow these steps to Duplicate images and cut across the page.

1. Create your page size. In this example we chose 4.25" x 4.25". You can choose a custom size to fit your labels. In this case we wanted to choose a height that was able to accommodate 2 rows and two columns of 2.125 x 2.125 cut to 2" x 2".

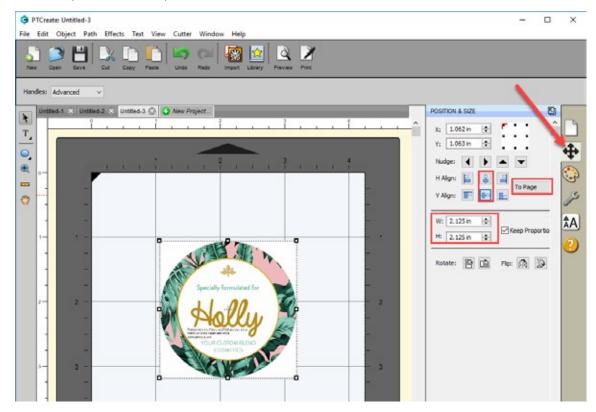

New Project	
Name:	Untitled-3
Page Size:	Custom Size ∨
w:	4.25 in
H:	4.25 in
Orientation:	Vertical (Portrait) \sim
Units:	Inches ~
	Cancel OK

2. Import your image using the import lcon.

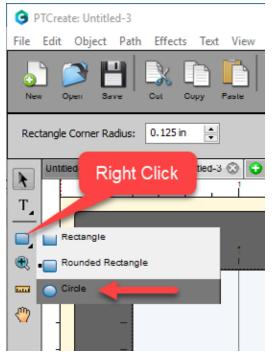

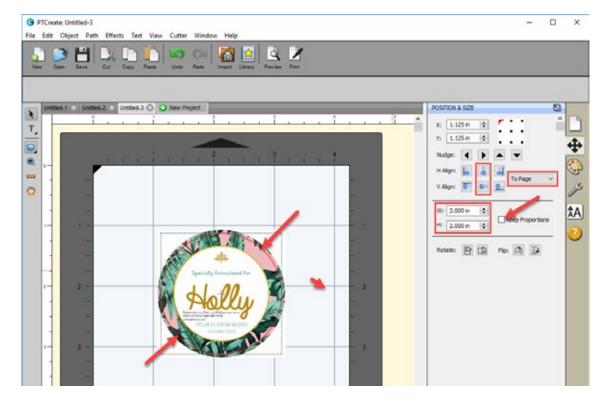

3. Set the Size and Position. In this example we are setting the size to 2.125 x 2.125. Center the image horizontally and vertically.

- 4. Create your cut line using the shape tool on the left size tool bar. Right click on the rectangle icon and choose the circle tool.
- Draw the circle close to the size of the images. You don't have to be accurate on this step since we will be changing the size and position in the next step.
- 6. Set the size to correspond to the actual cut label size you would like. In this case we set the size to 2" x 2 so that we have a standard 1/16" bleed around the label. Uncheck the Keep Proportions box. This will make sure that no labels have any white unprinted areas around the edges.

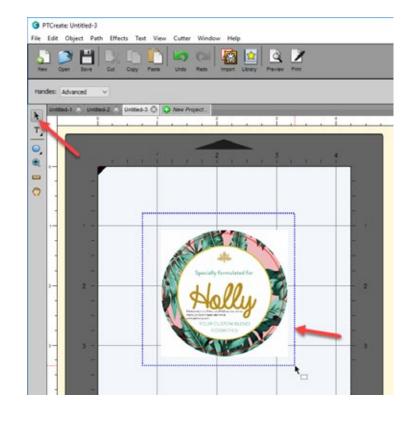

7. Center the cut line horizontally to the page

8. Using the arrow tool select both image and the cut line by drawing a box around them.

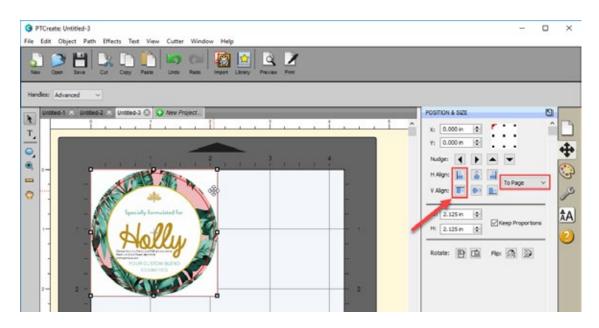

9. Group them together by going to the Object Menu – Group. This will ensure that cut says with the image and in the correct relative location while we move and duplicate the image in the next steps.

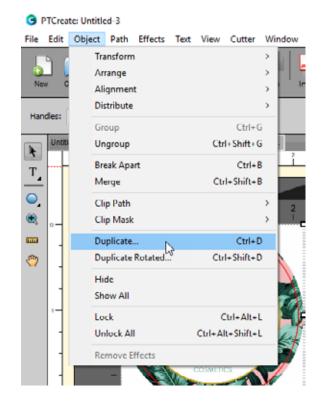

File	Edit	Object Path Effects	Text	View Cutte	er Win	dow	Help			
Ne	w o	Transform Arrange Alignment Distribute			> > >		port Lib	ary	Preview	P
ridi	ures.	Group		Ctr	I+G

Т,		Break Apart Merge		Ctr Ctrl+Shif	1+B t+B			- 1	3	-
•		Clip Path Clip Mask			>	2	1 1	-	3	4
		Duplicate Duplicate Rotated.		Ctrl+Shift	I+D t+D					
		Hide Show All								
	-	Lock Unlock All		Ctrl+Al Ctrl+Alt+Shif		E.	A	M		
	2-	Remove Effects		•	Spec A	lol	s nulated fr	Y	No.	

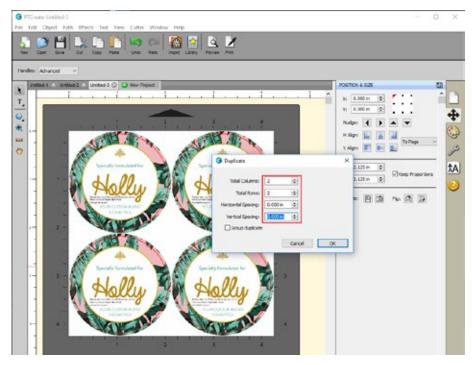

10. Align the group image and cut line to the upper left corner.

- 11. Now go to the Object Menu and click Duplicate. Make sure the image and cut line are still selected otherwise the Duplicate item will not be available.
- 12. Set the number of rows and columns.
- Set the gap between the rows and columns.
 In this case we are setting the gaps to zero.
 We already created a bleed so the cuts will not intersect or be too close to each other with zero gap between prints.
- 14. To print go to the File Menu and choose Print or click the Print Icon on the shortcut bar. The print dialog will appear. Make sure Print+Cut is selected. Click the Properties button to access the printer settings such as Print Quality, Saturation and Color Matching. For a full explanation of printer driver settings see section 5F.

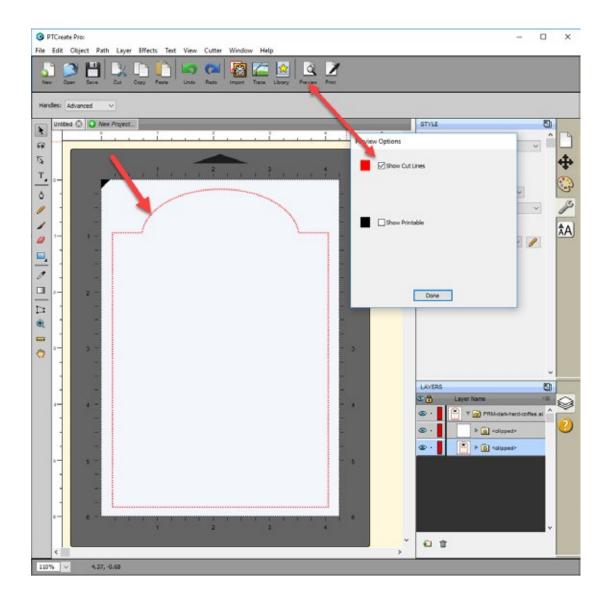

4G Print Preview

Before you print you can click the Preview button to verify what objects will cut and what objects will print. Check either Show Cut Lines or Show Printable to see what will print or cut.

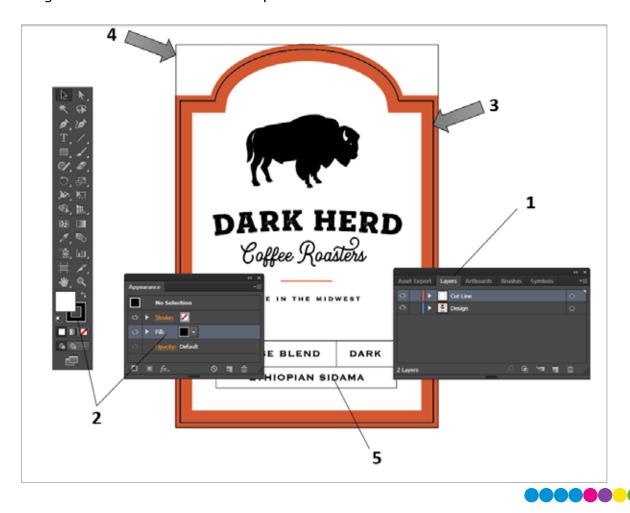

4H Vector File Specifications for Designer

When importing files using the methods described in section 4 please make sure the imported file follows the specifications below:

- 1. Place the design on a top layer. Place the cut line on another top layer at the same level as the design. Do not bury the cutline inside the design.
- 2. The cutline should be a compound path set as outline. Set the color to any color that stands out against the design.
- 3. Position the cut line exactly where you want it relative to the design. The cut line should be the size of the final label. The minimum over bleed should be 0.040".
- 4. The workspace should match the full bleed of the design to be printed.
- 5. Convert fonts to vector graphics by outlining them. (In Illustrator, select the text go to the Type Menu -Choose Create Outlines.)

6. Save the design as a vector file in this order of preference. 1. SVG File 2. AI File 3. PDF File.

4I Tutorial How to setup a Print and Cut in PTCreate Standard

This tutorial will walk you through the basic steps to print and cut a label.

4I.1 Choosing a Label Size (Page Layout)

After you activate your software you will be prompted to open or create a new project.

1. Choose New Project...

0	New Project	Click "New Project" to start a new blank project with default settings.
9	Open Project	Click "Open Project" to continue working on an existing project.
	Recovered Projects	Continue working on recovered projects.
ecent Projec	tts	Clear Recent

2. Set your page size. Since all die cutting media is 4.25" wide the standard maximum width is automatically set to 4.25. In this example we have set the size to 4.25 x 3 to accommodate approximately a 4" x 3" label.

New Project		
Name: Page Size: W: H: Orientation: Units:	Untitled-1 Custom Size 4.25" x 1" 4.25" x 2" 4.25" x 3" 4.25" x 4" 4.25" x 6" 4.25" x 6" 4.25" x 12" Custom Size	Tip! Set your page larger than the label size to be cut. This will allow you to create a bleed around the label so that you always cut inside your print and get perfect cut every time.
	Cancel OK	

3. To set the page height or width to a custom size type the size in the W: and H: boxes or toggle the size up or down with the arrows.

New Project					
Name:	Untitled-1				
Page Size:	Custom Size ∨				
W:	4.25 in 🚖				
H:	10.000 in 🚔				
Orientation:	Vertical (Portrait) 🛛 🗸				
Units:	Inches ~				
	Cancel OK				

4I.2 Import a flat Image (JPG, BMP, PNG, TIF, GIF)

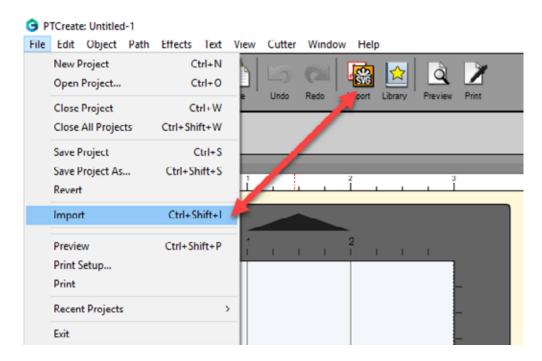

PTCreate Standard allows you to import flat files for printing only. You can import the following image formats: JPG, BMP, PNG, TIF, GIF.

Important Note: Primera recommends imported images are at least 300 DPI. The software is optimized for this size. Larger DPI images can be manually resized. Smaller DPI images will not utilize the maximum quality of the printer and may appear pixelated. Images downloaded from websites are typically made to display only onscreen load quickly so they are typically only 72 DPI.

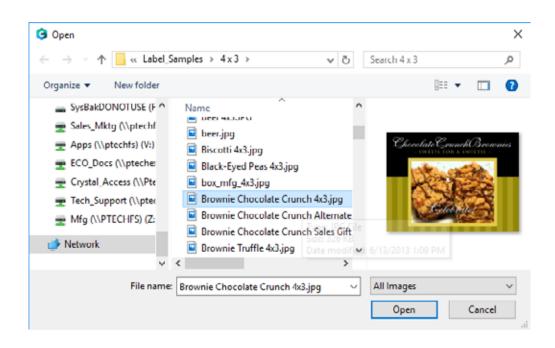

To import an image for printing follow these steps.

1. Go to the File Menu or shortcut bar, choose Import.

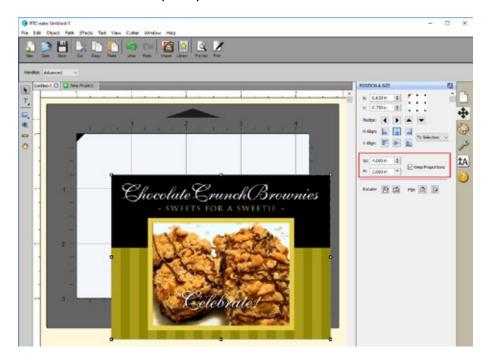

2. Browse to the file you would like to use and choose Open.

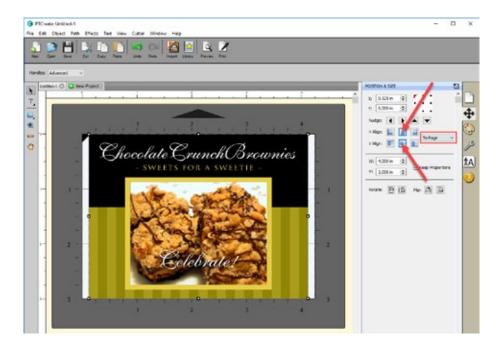

- 3. The file will appear on your page layout.
- 4. You can manually move it on your page or increase the size. However, a better option is to use the Position and Size window. Set the size to match the size of the page layout. In this case set the width to 3.25" and check the Keep Proportions box.

5. Center the image horizontally and vertically to the Page.

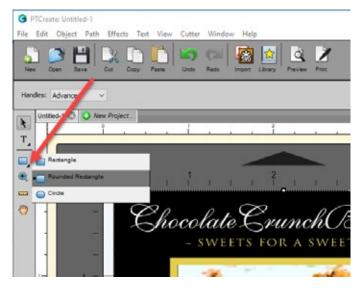

4I.3 Add a Cut file

In PTCreate Standard you can either draw a box in the approximate location of the cut file or use one of the preset size from the library. If you have a rectangular label or you would like to add a corner radius to your cut it is preferable to draw the cut line. Corner radius make it easier toremove your label from the liner. In this example we will draw the cut line.

1. RIGHT CLICK on the rectangle icon and choose Rounded Rectangle.

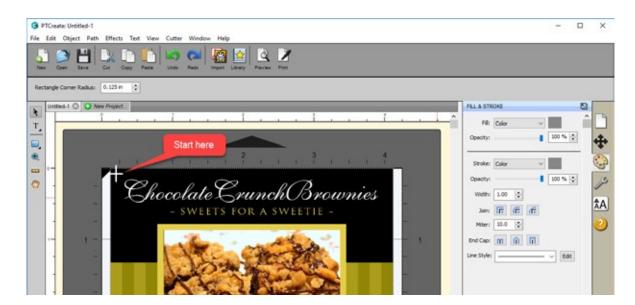

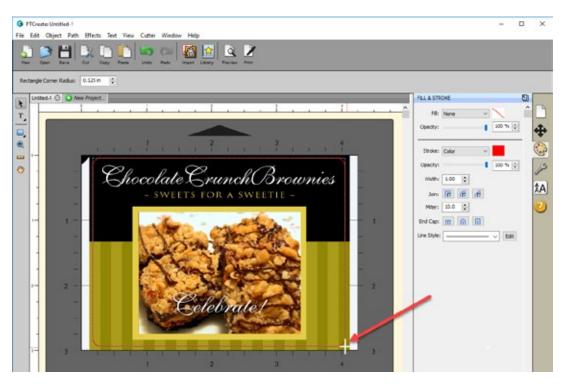

2. Before you start to draw the cut line, adjust the corner radius. You will not be able to change this after you draw your cut line. The corner radius is the amount of curve around the corners. .125 in (1/8 Inch) is the standard corner radius.

G PTCreate: Untitled-1								
File	Edit	Object	Path	Effect	s Text	View	Cutter	W
Q Ne) Open Sa	ve	Cut	Сору	Paste	Undo	Re
Rec	_	Corner Ra	l	0.125 ir				
T				Tojec	·k		1	
							1	
•	0-				I	I	-	

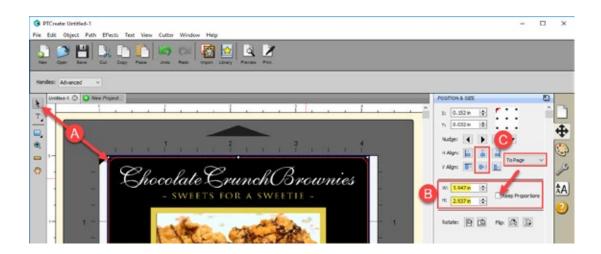

3. Draw the cut line by hovering your mouse over the top left corner of your design. When you are ready to start, left click and hold to start the rounded rectangle box. Keep holding the left mouse button and move to the lower right corner of your design. Let go of the mouse button when your box is the approximate size you would like it. We will adjust the exact size and position in the next step but to maintain a proper corner radius it is important to get as close as possible in this step.

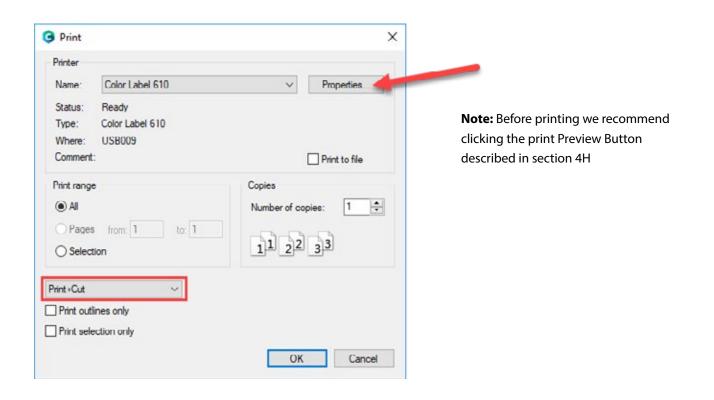

- 4. Once the cut line is in place you can adjust its size and positon. Whatever size you choose will be the exact size of final cut label. A typical overbleed is 1/16". This will ensure that the cut is completely within the printed label every time so you have no white space around the edges.
 - a. First select the cut line using the arrow tool. TIP: If you are having trouble selecting the object, first select any object and then press the TAB key to move the selection from object to object.
 - b. Then change the size. Adjust the size to 1/16 (.0625") less than the height and width of the print.In this example the cut file would be 3.937 x 2.937. You may have to uncheck the Keep Proportions box.
 - c. Finally adjust the position by centering horizontal and vertical alignment to Page.

4I.4 Print.

To print go to the File Menu and choose Print or click the Print Icon on the shortcut bar. The print dialog will appear. Make sure Print+Cut is selected. Click the Properties button to access the printer settings such as Print Quality, Saturation and Color Matching. For a full explanation of printer driver settings see section 5E

Section 5: Printing only to Pre Die-Cut labels

If you don't need to cut custom shapes, the LX610e is an extremely capable Pre Die-Cut Label printer. While PTCreate can print only to the LX610e other dedicated printing programs offer some advantages.

5A Create a label with NiceLabel

1. Select "New Label". Select the Printer "Color Label 610". Click "Next".

		Cancel < Back Next >	Finish

After you click "Finish", you can always go back and change any of these "Label Properties" settings, by going to the Menu Bar and select "Document Properties" or double click on the blank label.

Once you have created your label size you can start to design your label using tools from the tool box/ button bar. You will need to add text, rectangles, lines and/or graphics. This can be done using one of the buttons on the button bar at the top left screen.

Click the Text buttons to add text to your labels. Edit the text on screen or double click to open up text settings to change font, size and other settings.

Click the Picture button to add graphic. Click anywhere on the label. A pop-up window will open to browse to the image/graphic and select it with "Open".

Click the Rectangle, Line and Ellipse button to add geometrical shapes.

Click the Barcode button to add a bar code. Double click the bar code to choose the bar code type.

- Tip 1: Double-click any object to open settings for that object.
- Go to the Help tab to access the NiceLabel Manual and Tutorials Tip 2:

Inverse

5A.1 Printing from NiceLabel

- 1. To print, click the Print button or go to the File Menu and select "Print". The Print Dialogue window will appear.
- 2. Select the "Color Label 610".
- 3. Set the number of copies.
- 4. Click "Printer Settings" to adjust the settings.
- 5. Click "Print".

Congratulations! You have successfully created and printed your first label. You can find more tips and hints by simply clicking Help in the main menu

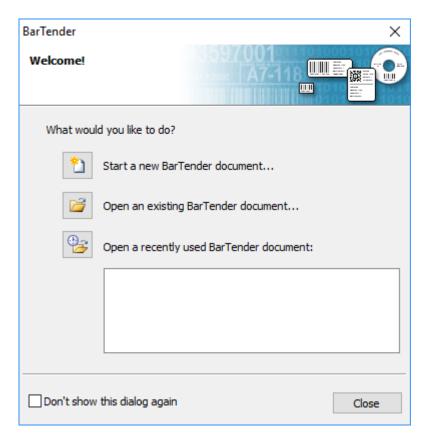

5B Using BarTender for Pre Die-Cut Printing

Primera recommends BarTender for printing only. A fully functional Free Edition can be downloaded from the BarTender website.

https://www.bartendersoftware.com/free-edition-download/

When you open BarTender you will be given the choice to select an existing label or create a new one using a wizard. Use the following instructions as a guide through the wizard setup process.

1. Choose "Start a new BarTender document..."

2. Select "Blank Template". Click "Next".

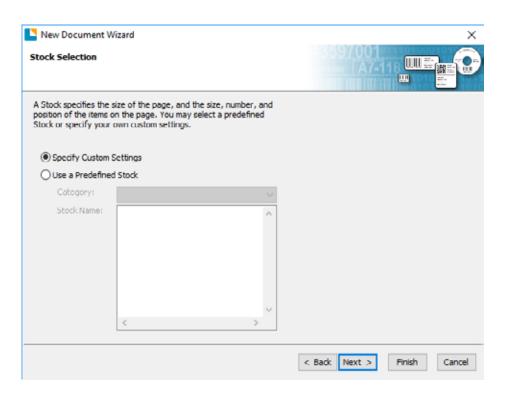

New Document Wizard	×
Starting Point Select the starting point for the new document.	
You can start with a blank template, or a pre-designed template from a library of several common standards.	
Starting Point:	
Blank template	
○ Select template from library	
Select	

3. Select "Color Label 610e". Click "Next".

New Document Wizard		697001
Speafy the printer to use with this document.

5C Add Text, Barcodes and Graphics to a BarTender Label

Once you have created your label size you will be able to add text, a barcode and/or graphics. This can be done using one of the buttons on the button bar at the top of the screen.

button to change your label size, adjust corner radius or change the shape. **Add Barcode.** Click the Barcode button. Now click anywhere on your label. A barcode settings window will appear. Here you can choose any type of barcode and enter the value.

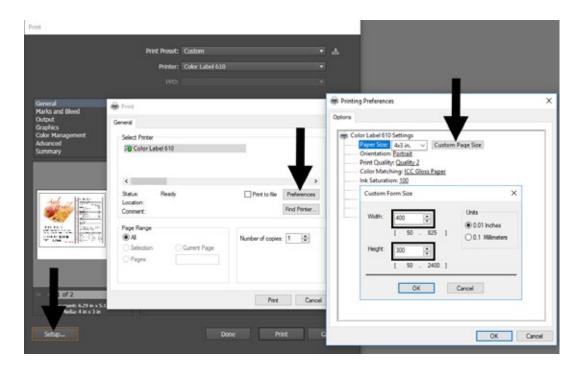

Tip! Double-click any object to open settings for that object. **Tip!** Go to the Help menu to access the BarTender Manual and Tutorials.

5D Printing from Other Programs

Since this printer uses a standard Windows printer driver you can print from any application you would like. There are just a few things to remember that will make it much easier.

 Set the Page/Label Size in the Driver. BarTender automatically prompts you for the size of the label that you are using. When printing from any other program you must do this manually. Before you print, simply set the custom page size just as you would set print quality in the printing preferences. In the example below the label size is 4" x 3" so the custom page size is set to 400 x 4300 (displayed in .01 inch units).

- 2. Check the image or document size. The image size or document size set in Illustrator should match to the Page/Label Size set in the driver. If you have set your page size to 4" x 4" but your image is actually 5" x 3" the printer driver will automatically shrink your image to fit inside the 4" x 4" label. The result is that the actual printed label is 4" x 2.4". Avoid this by setting your document size or image size to match the label size.
- 3. Choose the right printing program. There are many different applications that are capable of printing to the LX610e. However, there are only a few that are ideal printing applications. For example, Adobe Illustrator is an excellent design program but is not always the best printing program. It can be difficult to find the printing preferences or to know the exact size of the art board. It is best to save as a PDF file and print from Adobe Reader or export as a 300 dpi JPG and print from BarTender.

5E Creating a Full Bleed Print

To create a label that completely fills the space with no white margins, adjust these settings in the status monitor and printing application (BarTender). This is only necessary if you are printing to Pre- Die Cut Label stock. If you are printing and cutting using die cutting media, you can adjust the position of the cut line to accomplish this.

Page Size. Increase the page size width by .03 inches (1 mm). Increase the height by .03 inches (1 mm). If you are using BarTender, simply change the size under the File Menu - Page Setup. If you are using other graphics programs you will need to change the page size in the application and in the printer driver preferences.

rint	Object Print Me	hod	
Ppints N ==== SI (Di Pt	Color Label 610 Options	610 Settings	
Q	Orientat	Custom Custom Page Size ion: Portrait Ion: Portrait aality: Quality 2 Custom Form Size	×
0 - F	Ink Sat Enable Launch Details	Width: 428 Image: Width [50 500 Height: 425 Image: Width [50	
Te		OK Cancel	

Left Margin Offset. You must decrease the left margin offset to center the over bleed on the label. If you over bleed by .03" you will need to decrease the Left Margin Offset by 0.4 mm. This will center the page size increase so there is a .03 inch over bleed on both left and right sides. Some additional adjustment may be necessary if the label was not perfectly aligned to begin with. See Section 4E.

TOF. Increase the Top of Form by 0.4 mm. This will cause the printer to start printing before the label and ensure a fully printed label. Some additional adjustment may be necessary if the label was not perfectly aligned to begin with. See Section 4E.

Primera PrintHub				-		×

Note: It is best to over bleed as little as possible to avoid excess ink on the label backing. Also, over bleeding too much will cause the printer to skip labels. This is because the printer stops printing too late to sense the next label.

5F Printer Driver Settings

Once the printer driver has been successfully installed, you will need to setup the driver with the appropriate print options. Refer to the following steps to change or verify your default printer driver preferences. These settings will apply to all new designs created in BarTender or other programs after the preferences were changed. Existing labels saved in BarTender will not be affected since the preferences are saved with the label. To change these preferences, you will have to change printer preferences through BarTender. (File Menu - Printer Settings)

Click the Start button, search for "Printers". Select Printers and Scanners. Select the Color Label 610. Choose Manage. Select Printing preferences.

Note on PC Settings:

Most applications allow you to change these same printer driver options from their "Print" and/or "Printer Setup" screens. Some applications such as BarTender save your settings with the label, others use settings only for the current print job just sent to the printer.

Paper Size

If you are using BarTender, this setting is adjusted during the label setup wizard. If you are using a program other than BarTender you will need to set this to the dimensions of your label. Keep in mind that the dimensions are always relative to the width and height of the actual label in the printer. Orientation of an image on the label should not change this setting. See Section 2A for minimum and maximum label sizes.

Orientation

There are two settings for orientation, Portrait and Landscape. If your text and graphics print left to right or as shown on the screen, select portrait. If you wish your printing to rotate 90 degrees from what you see on the screen so it is printing horizontally, select landscape as your orientation. Remember, this does not change the width and height Paper Size. It is only a tool for viewing a label upright on screen that will be printed sideways on the printer.

Print Quality

There are 4 levels of print quality in the driver. The lower the quality, the faster the print. Quality 1 provides the fastest print available while Quality 4 provides the best quality. It is recommended that you experiment with the different levels when designing your label to find a good balance between print quality and print speed. Quality 2 is the default.

Color Matching

There are several options available depending on which cartridge is installed (Pigment or Dye). The options will update automatically depending on which cartridge is installed.

Vivid Graphics mode is best used for graphical images where accurate color reproduction is not as essential. Images printed in this mode will look more vibrant because more ink is being used to produce them. However, printing images of people may produce skin tones that have a reddish tint.

Vivid Photos mode is best used for photographic images where accurate color reproduction is very essential. Images printed in this mode will look lighter than those printed in Vivid Graphics mode. Skin tones especially will look more natural in this mode.

ICC Gloss Paper, ICC Gloss Polyester and ICC Matte Bopp are all ICC calibrated color matching options. Select the setting that corresponds to your installed Primera media of the same type to produce ICC color matched prints. Note: ICC monitor calibration and additional setup is required for this option to work.

-NONE- will use no color matching.

Ink Saturation

This option controls the amount of ink used when printing an image. The default setting is 100%, which will provide the most accurate color matching. If the ink is not drying fast enough or "bleeding", you can decrease the Ink Saturation to lessen the amount of ink that is applied to the label.

Rotate 180 Degrees

Set this setting to Yes to print with the labels right side up as they exit the printer.

Enable Bi-di

Set to "Yes" for fastest print speed. Requires an alignment print after every cartridge change. Set to "No" for better quality print (in some cases).

Launch PrintHub

This setting will open the Primera PrintHub application.

Details

Select this setting to see current firmware and driver version information and other printer settings.

Section 6: Printing from a Mac

6A Print Utility Settings (LX610 Config Utility)

The LX610 Config Utility is used to interact with the printer for gathering ink levels, maintenance, alignment, and several other functions.

To Find LX610 Config Utility:

The LX610 Config Utility automatically installs with your printer driver and can be accessed through the Printer & Scanners in Mac under Apple Icon – System Preferences.

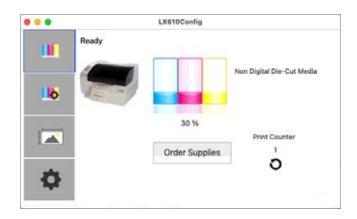

Printers PTI Color_Label_610	-	PTI Color_Label_610		
 Idle, Last Used 		Open Print Queue		
	All and a second	Options & Supplies		
	Location:	Patrick's Mac mini		
	Kind:	Primera LX610, 1.3		
	Status:	ldie		
	Share this printe	er on the network Sha	ring Preferences	5
	Default printer:	Last Printer Used	Θ	
	Default paper size:		0	?

- 1. Connect the printer via USB and turn on the power. The LX610 Config Utility accesses most of the information it uses from the printer itself so the printer must be turned on and communicating for the program to open.
- Go to the Apple Icon System Preferences Printers and Scanners, select the PTI Color_Label_610, click on, Options & Supplies, and Open Printer Utility. Or you may simply print to the printer and the Utility will open.

- 3. The LX610 Config Utility has 4 tabs that are arranged on the top of the window. Each tab opens a screen that has various similar functions.
- **Status Tab** (First Tab). Displays ink levels, print counter and any error messages.
- **Cartridge Tab** (Second Tab). Use for aligning the cartridge, cleaning the cartridge, and changing cartridge.
- Alignment Tab (Third Tab). Adjusts vertical and horizontal print alignment. Changes the Stock Sensor Mode, toggles the Output/Cut Mode and XY Cutter Alignment Settings.
- **Settings Tab** (Fourth Tab). Displays printer information including firmware version, driver version, and software version. Check for updates and set other advanced settings.

6B Adjusting Print Alignment/Label Offsets (Pre die-cut Stock Only)

If your previous experience with printing is limited to printing letters and cards to 8.5 inch by 11 inch paper you probably are not familiar with an essential part of label printing – Print Alignment. Standard printers feed a sheet and start printing based on the start of the sheet. They also prohibit printing to the edge of the sheet. This is to avoid any need for alignment. The LX610 senses the beginning of the label with an optical edge. Because of this it is necessary to align the printer to work with specific types of label stock.

The LX610 comes from the factory calibrated to print exactly to the edge of Primera label stock. However, due to variability it may be necessary to fine tune these settings at the beginning of each roll. This is especially true for other non-Primera brand label stock.

Important Note: Before adjusting alignment settings first print one label at the quality level you intend for the entire print job. This will ensure the label stock is moving at the same speed and the stock sensor will sense the gap in the same way.

Adjust print alignment using the LX610 Config Utility. Click on the Alignment Tab (Third Tab).

Note: This section only applies to Pre Die-Cut Stock. For an explanation of stock types, please see section 2A.

Three items can be adjusted here:

Tear off Position. This value adjusts the position of the last label printed after it has been presented for tear off. This only applies if the output mode is set to "Present." Add to the current value to move the tear point closer to the printer. Subtract from the current value to move the tear point away from the printer. After adjusting the value click the Set Offsets button to send the value to the printer.

Left Margin Offset. This value moves the printed label left or right. Add to the current value to move the printed label to the right. Subtract from the current value to move the printed label to the left. After adjusting the value, click the Set Offsets button to send the value to the printer.

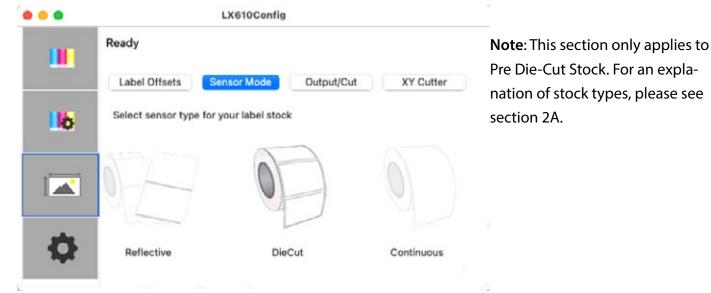

Top of Form (TOF). This value moves the print start position up or down on the label. Add to the current value to move the printed label down or toward the printer. Subtract from the current value to move the printed label up or away from the printer. After adjusting the value click the Set Offsets button to send the value to the printer.

You may have to make several adjustments to one or more of these values. After each adjustment you can click the Test Offsets button to print a small test pattern on the label. This will help you find the proper alignment value.

6C Set the Stock Sensor Mode (Pre Die-Cut Stock Only)

The stock sensor mode refers to the method the printer will use to detect the print starting position for each label. To access the Stock Sensor Mode, click on the Alignment button, then select Stock Sensor Mode. In most cases you will not need to change this setting.

Important Note: Set the Stock Sensor Mode BEFORE loading label stock!

You must also set the Stock Sensor Position (Section 2D) so that the sensor is sensing the correct point on the label stock.

Die Cut (Default). If you are using standard die-cut labels that look similar to the graphic use this setting regardless of the size of the label. Also, use this setting for through-hole label material where a hole is punched through each label or a notch is cut on the side.

Reflective. Use Reflective for label material where a black preprinted line (black mark) on the back of the label stock indicates the break between labels. Black marks are required on clear label stock rolls, or labels where the label waste matrix (waste) is left on the liner. Black marks can also be used for irregular shaped labels, circles larger than 4.6 inches or on any stock where the print starting position cannot be sensed using the label itself.

Continuous. (Sensor off.) If you have continuous stock with no die-cut, reflective mark or holes, set the Sensor Type to Continuous. This will turn off the stock sensor. In this mode there is no way to set the print starting position. The printer will simply start printing the first label and print each subsequent label immediately after the previous. To produce a gap between prints simply add the desired amount of white space to the end of the label being printed.

6D Set the Output Mode

Use the Present/Cut Mode to adjust how the printer presents labels after they are printed or if/when they are cut after printing. There are different options available which change if the Cutter is enabled or disabled. If the Cutter is disabled, the label present options will be available. If the Cutter is enabled the present options are no longer available but cut options become available.

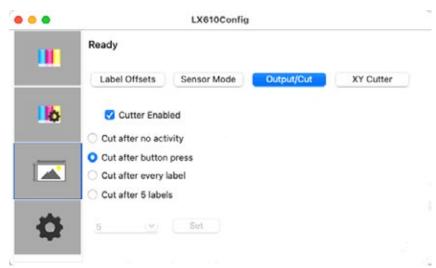

Cut Options (Check Cutter Enabled):

Cut after no activity. This setting will cut at the end of a print job if the printer does not receive another print job within one second of the last print job in the queue. You can use this feature to cut at the end of multi-copy job, multi-page job or multiple individual jobs in the queue.

Cut after button press. This setting will cut after you press the Load/Feed button on the printer. This can be used after one label or an entire job. This feature is useful if you will not be present at the end of the print to catch the cut label.

Cut every label. This setting will cut after every label.

Cut after label count. This option will cut after the number of labels specified in the toggle box that appears when this option is selected. This is useful if you have front/back labels or sets of labels.

Present Options (Uncheck Cutter Enabled)

Do not present. In this mode the label stock does not move after the last label is printed. This means that part of the last label printed is still in the printer. This should be used only if you have a label rewinder at-tached.

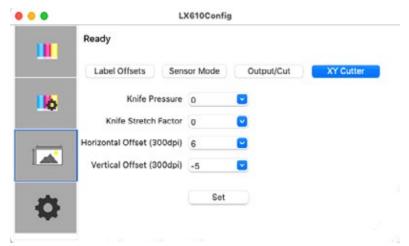

Present after no activity. This setting will present (feed all printed labels past the tear off point) at the end of a print job if the printer does not receive another print job within one second of the last print job in the queue. You can use this feature to present at the end of a multi-copy job, a multi-page job or multiple individual jobs in the queue.

6E XY Cutter Offsets (Digital Die-Cut Stock Only)

Cut Offsets, Knife Pressure and Stretch Factor settings can be found in Primera Print Hub on the XY Cutter Tab.

Cut Offsets If your cut does not line up with your printed image, you can adjust it using the **Horizontal Offset** and **Vertical Offset** settings. Press the Send Test Print to help you determine which direction to move the offsets or refer to the image below.

Knife Pressure affects how deep into the media the knife will cut. Ideally you want to cut deep enough to cut through the label layer on the top but not so deep that you cut through the backing paper (liner). When you cut through the backing paper your label will not peel cleaning off the backing paper. You will also score the wear strip under the cutting knife which can cause the knife tip to break. You will also need to replace the wear strip more often if you cut too deep.

By default, the cutter is calibrated to work with High Gloss Paper Media. However, other media types will need more or less cut pressure to cut properly.

Each roll of media will have a recommended value to add or subtract from the default baseline values used for Knife Pressure and Knife Stretch Factor. These values are listed below and printed on a label attached to the inside of the core.

	Knife Pressure	Stretch Factor
High Gloss Paper	0	0
High Gloss BOPP	4	0
Magnetic	22	32

Knife Stretch Factor can be increased or decreased to compensate for different feed thicknesses and textures of media. Thickness and texture can affect the feed speed of the media usually causing it to feed more slowly than the baseline media (High Gloss Paper). This will cause the height/length of your cut to be shorter. If you find that your cut height/length is longer or shorter than the height specified in the PTCreate software, you may need to increase or decrease the stretch factor. Increasing this value with create a longer cut. Decreasing it will create a shorter cut.

Adjusting Knife Pressure over time.

Eventually, the knife blade will begin to wear and require more cut pressure to cut at the same depth as when it was brand new and sharper. Therefore, you may need to add cut pressure when cutting any media even the High Gloss Paper.

To determine if cut pressure needs to be increased or decreased, follow these steps.

- 1. Print and Cut 1 copy and then attempt to peel the label from the liner.
- 2. Check for tear. If the label tears when you remove it, you will need to increase the cut pressure. Increase pressure in small increments to avoid over compensating and cutting through the liner.
- 3. Check the liner. Once you peel up the label, check the liner. If it has been cut through, decrease pressure.
- 4. Continue increasing or decreasing pressure until the label no longer tears when removed or the liner is not cut through.

Note about Magnetic Media. The recommended starting knife pressure for the magnetic media is 22. This media is not meant to be cut all the way through because there is no liner. Instead, this knife pressure setting is meant to score the magnetic media so that it can be removed by hand after printing. In some cases, it may be necessary to tear the outer excess material from the intended shape.

If you do cut all the way through this media, it can damage the wear strip, break the knife tip or cause media jams.

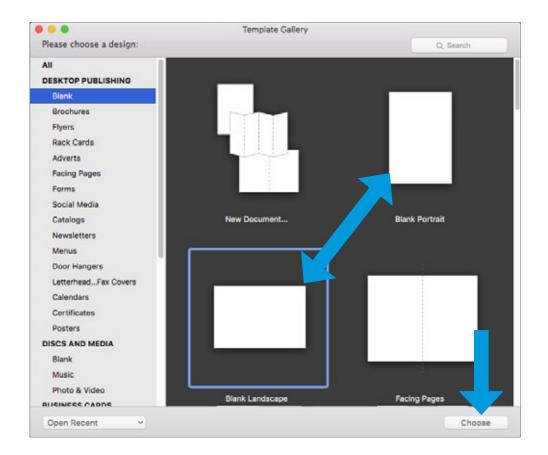

6F Printing from Swift Publisher (Pre Die-cut Stock Only)

Swift Publisher is an inexpensive software that can be used to design/layout and print your labels if you are using a Primera label printer attached to a Mac. Below is a tutorial on how to setup a label using Swift Publisher by Belight.

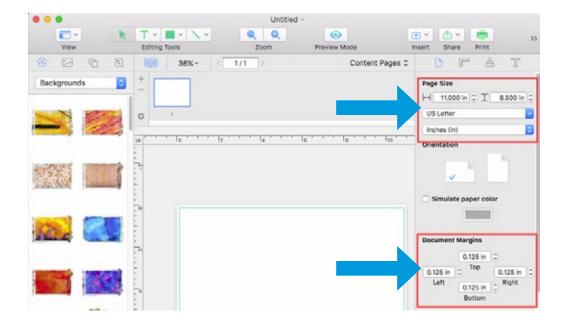

Download a Free Trial Here: https://www.swiftpublisher.com/

Note: This section only applies to Pre Die-Cut Stock. For an explanation of stock types, please see section 2A.

When you open the software for the first time you will be asked to choose a Template. Select Desktop Publishing – Blank. (Do not choose from the "Labels" category!) Choose either blank landscape or portrait. Click Choose.

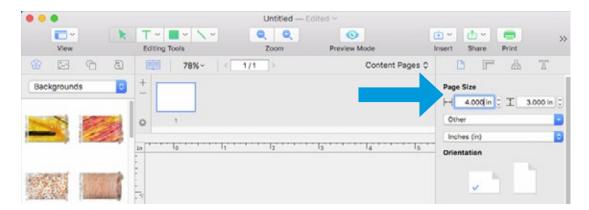

1. It automatically defaults to 8.5 x 11. We will need to adjust the page size and the margins.

2. Type in the size at the top.

Important Note: The page size is not the same setting as the label size. In many cases you will choose the same size for both. However, if you change the orientation of the label so you can see text/graphics upgright on screen but the actual print will be rotated, you may need to choose the opposite setting for the label size. For example: Page Size = 3x4. Label Size = 4x3. Do not change the orientation as it will change the page size. Orientation is set automatically depending on the page size.

3. Next, set all margins to zero. This will allow you to create designs that completely fill the label.

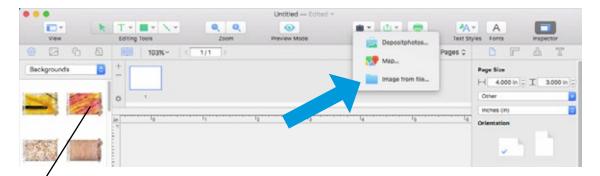

ß	i d	4 1	0
Page Size			
4.00	0 in 🗘 I	3.000	in Ç
Other			
Inches (in)		٥
Orientatio	n		
Simulat	Margins	lor	
	0.000 in	\$	
0.000 in	СТор	0.000	in C
Left	0.000 in	2 Right	
	Bottom		

4. Add Text, Barcodes, shapes and images to your design.

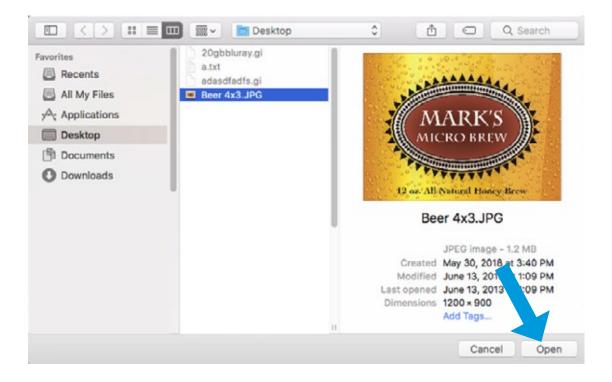

5. For this example, we will add an image that we created. Click the insert Icon and choose Image from file....

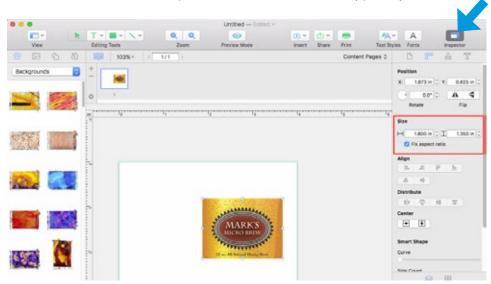

Note: You can also add images from the Backgrounds menu included with Swift Publisher. Simply drag them to your template.

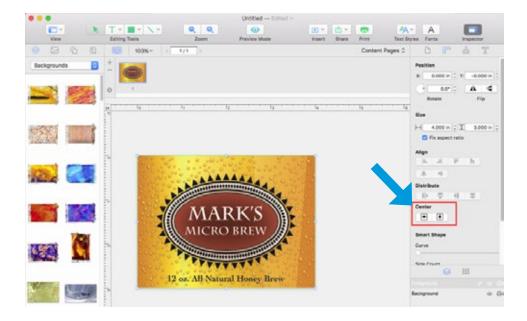

6. Once your image is imported into your template you will need to adjust the size to fill the entire template (if that is your intention). Adjust the size by clicking the ruler icon in the Inspector with the image selected. Check the "Fit aspect ration" box and then type in your size.

7. Now center the image by clicking both the horizontal and vertical centering buttons.

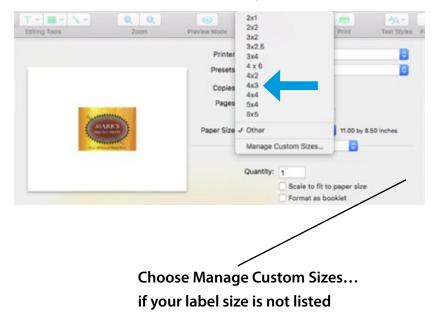

- 8. You are now ready to print. Click the Print icon to open the print dialog box.
- 9. The default label size is 8.5 x 11. You can see this is not correct by looking at the preview. Always adjust the Paper Size to match the label stock size installed in the printer.

	Printer: PTI Color,Label,600 Presets: Default Settings Copies: 1 Pages: 0 All From: 1 to: 1
ALLED	Paper Size: Other 😒 11.00 by 8.50 inches Swift Publisher 5
C 1el1	Quantity: Guartity: Guartity: Guartity: Guartity: Format as booklet Format as booklet Horizontal Vertical
	Mail Merge: Print List.
? PDF 📴 Hide Details	Cancel

10. In this case we can choose a preset size (4x3) to match the label size installed in the printer.

11. You can now see the preview is correct, the paper size is set so you are ready t	o print.

6G Creating a Custom Page Size - Mac

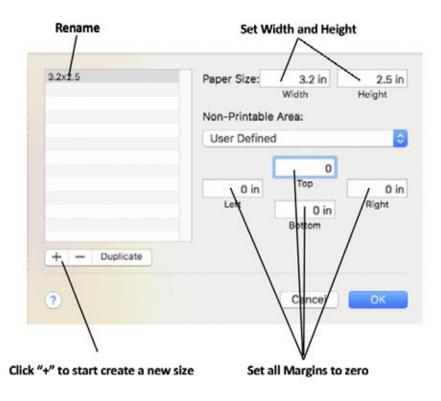

In many programs such as Adobe Illustrator, Photoshop or Acrobat Reader you will need to choose your label/page size before you print. If the label size you need to use is not already on the list of available pages sizes you will need to create a new custom size on the print screen of the program you are using to print.

1. Click the Paper Size drop down menu. Choose Manage Custom Sizes.

Printe	r: PTI Color_Label_600 3x2
Preset	s: Default Settings 3x2.5 3x4
Paper Siz	Swift Publisher 5 5x5
	✓ Other Manage Custom Sizes

- 2. Click the + to create a new size.
- 3. Enter the actual width and height of your label stock.
- 4. Set all margins to zero.
- 5. Rename the size the same as the width and height.

6. Your custom size will now appear at the bottom of the preset size list in this application and any other application on this Mac.

Note: If you need to overbleed your image to achieve complete coverage of your label, you would use this process to create a custom size which is .03" (or less) larger than your actual label stock. For Example 4.03" x 3.03" for a 4" x 3" label.

6H Creating a Full Bleed Print – Mac (Pre Die Cut Stock Only)

If you are having trouble making the image cover the entire label, first make sure the image is printing at least as big as the label size you have selected. Increase the selected page size by .03 inches on the width and .03 inches on the height to create an over bleed.

Note: Make sure under scaling options to select 'Fit to Page' in the print dialogue box if printing from Illustrator.

Left Margin Offset. You must decrease the Left Margin Offset to center the over bleed on the label. If you over bleed by .03 inches, you will need to decrease the Left Margin Offset by 4. This will center the page size increase so there is an over bleed on both the left and right sides.

TOF. Increase the Top of Form by 4. This will cause the printer to start printing before the label and ensure a fully printed label.

Note: This section only applies to Pre Die-Cut Stock. For an explanation of stock types, please see section 2A. It is best to over bleed as little as possible to avoid excess ink on the label backing. Also, over bleeding too much will cause the printer to skip labels. This is because the printer stops printing too late to sense the next label.

6l Printer Driver Settings

Printer driver settings are accessible on the print window of any application right before you click print.

Printing from Swift Publisher

Click on the Swift Publisher 5 dropdown menu and choose Printer Features.

Printing from Adobe Reader

First click on Printer... to access settings. Click on the Layout dropdown menu and choose Printer Features.

Print Quality

There are 4 levels of print quality in the driver. The lower the Quality, the faster the print. Quality 1 provides the fastest print available while Quality 4 provides the best quality. It is recommended that you experiment with the different levels when designing your label to find a good balance between print quality and print speed.

Color Matching

Best for Graphics mode is best used for graphical images where accurate color reproduction is not as essential. Images printed in this mode will look more vibrant because more ink is being used to produce them. However, printing images of people may produce skin tones that have a reddish tint.

Best for Photos mode is best used for photographic images where accurate color reproduction is very essential. Images printed in this mode will look lighter than those printed in Photo mode. Skin tones especially will look more natural in this mode.

Note: Exact color matching of the printed labels to the screen may never be possible since there are factors that affect this out of the drivers control. The surface of the label reacts with the ink in the cartridge to produce the color. For this reason, when printing the same image to different types of labels with different surfaces the printed output can look entirely different.

Ink Saturation

This option controls the amount of ink used when printing an image. The default setting is 100%, which will provide the most accurate color matching. If the ink is not drying fast enough or is bleeding, you can decrease the Ink Saturation to lessen the amount of ink that is applied to the label.

Enable Bidi (Bidirectional) Printing

Set to "Yes" for fastest print speed. Requires an alignment print after every cartridge change. Set to "No" for better quality print (in some cases).

Section 7: Troubleshooting

7A Solving Pre Die-Cut Print Alignment Problems

Image is Vertically Offset (White space can be seen on the top or bottom of the label) The LX610e decides where to start printing by detecting the start of a die-cut label, detecting a black mark on the back or detecting a thru-hole that corresponds to the start of the label. The following items can cause the label sensor to improperly detect the start of a label:

1. TOF Offset. TOF stands for Top of Form and this setting allows you to fine tune the alignment of your printing on your label stock. This will be factory calibrated. If fine tuning is needed, increase this setting to move the image down on the label; decrease this setting to move the image up on the label. The unit of measure is 0.1 mm.

2. Nonstandard / Non-translucent Backing Material. Test the unit with approved label stock from Primera (ask tech support to send a sample). If it prints correctly, your label stock may not be compatible. The label sensor needs to see the difference between a label and a backing material by seeing through the label stock for light variations. If it cannot see through the label, problems will arise. If you must use this type of backing, try label stock that has a black mark on the back to show where the label begins. You will need to change the Sensor Type setting in the driver preferences to Reflective if you switch to a label with a black mark on the back.

3. Improper Label Gap Distance. If the gap between labels is too small there will not be enough time for the gap to be detected. See Label Specifications.

4. Page Size is Bigger than Label Stock Size. If the page size set in the driver is larger than the actual label stock, ink will be printed on the gaps and the sensor will start looking for a gap too late. This can cause label skipping or inconsistent print starting points.

5. Portrait / Landscape. If the Portrait / Landscape setting does not correspond to the label stock installed this will also cause the printer to print over the gap and onto the next label. Make sure this is set correctly.

6. Sensor Position. Circular, nonstandard label shapes or multiple labels across will require precise adjustment of the label sensor. If you are using circular or other non rectangular die-cut labels see Section 2B for instructions.

The image is printing horizontally offset

(White space is seen on the left or right side of the label)

Two printer driver settings can affect this issue. Left Margin Offset. This adjustment is found in the Status Monitor. If you see white space on the right side of the label and overlap on the opposite side, increase the number. If you see white space on the left side of the label and overlap on the opposite side decrease the number.

(Negative numbers are allowed). Note: Usually a space on the right side indicates a margin around the label that is not being accounted for. The printer is factory calibrated for a 2 mm margin. A larger margin around the label will cause a right side space. Page Size. Often the page size is not large enough for the label. If this is the case you may see white space on the right side of the label and no image overlap on the opposite side. This indicates that the page size needs to be increased. Increase the page size through the printer preferences enough to cover the label..

7B Solving Cut Alignment Offset Problems

Cut alignment is calibrated at the factory. However, it is possible that you may need to adjust the cut line position for certain prints/cuts.

Adjust Cutter Offsets by opening Primera Print Hub. Go to the Printer Settings tab. Click on the Advanced Settings button. Adjust cutter offsets according to the diagram below. To move the cut to the right increase the Horizontal Offset. To move the cut to the left decrease the Horizontal Offset. To move the cut up increase the Vertical Offset. To move the cut down decrease the horizontal offset. Remember the top of your document prints first so it prints upside down if you are standing in front of the printer.

7C Maintenance

Replacing the Cutter Wear Strip

The wear strip is the surface directly underneath the cutting blade in the cutter mechanism. Over time this strip will wear down due to cutter knife pressure. It can also be damaged if the knife cuts through the liner and contacts the wear strip.

To replace the wear strip remove any media from the cutter mechanism. Power off the Printer.

Push the knife carrier gently to the left. Grab one end of the wear strip and pull it off the cutter. If necessary, use a utility knife to get under the strip to start it. The wear strip is held in place with adhesive so there may be adhesive residue. Clean off the adhesive with isopropyl alcohol. Remove the liner from the new wear strip. Press the strip into place. Make sure it is fully seated in the recessed pocket.

Wear Strip Location

(Red Color is only meant to highlight location)

Replacement Wear Strip Part Number 074549 (10 pack)

Label Cut Dust

Label cut dust can accumulate at any place along the cut path.

Paper media creates more dust than synthetic material. Dust build up does not cause any specific immediate problems but it can eventually cause problems with the moving parts and electronics in the cutter. Periodically vacuum the cutter area and rollers.

Cleaning the Printer

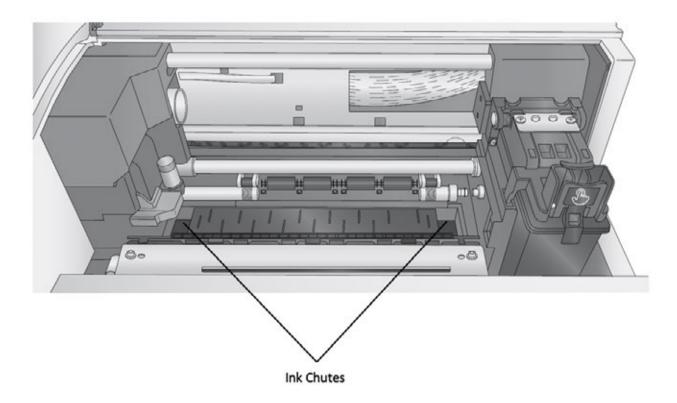

The case of the printer can be cleaned with an ammonia based window cleaner and a lint-free cloth.

Over time, ink overspray may gather at the base of the printer. The printer is designed using a vacuum system to gather most of this ink on a series of saturation pads. Eventually, these pads may need to be replaced. Contact tech support to determine if pad replacement is necessary.

Ink Accumulation - Chutes

Ink build up can occur in the spit chutes that leads to the ink saturation pads. Pigment Ink tends to build up faster than Dye Ink. Make sure there is a clear path for the ink to reach the pads below. Partially dried ink can accumulate around the sides of the chute. Use a ridged flat edge such as a pairing knife to scrap away the ink.

Ink Accumulation – Wipers (A software and firmware update may be required. Run the update first) If you notice that your print quality is poor at the beginning of a print but gets better as it continues to print, your ink wipers may have accumulated a combination of cut dust and ink. Check the wipers and clean them with rubbing alcohol and a cotton tip cleaner. Wipers are located on the right side of the printer but are normally hidden from view under the cartridge. You will need to put the printer in wiper maintenance mode.

- 1. Open the top cover.
- 2. Press and hold the pause button for 3 seconds until you see the print carriage move.
- 3. You will now have access to clean the wiper.
- 4. When complete close the cover.

7D Cleaning the Output Cutter

Every 2000 cuts you will be prompted to clean the output cross cutter using a cleaning card. If you have the card, you may follow the prompts to complete the cleaning procedure. Otherwise you can purchase a pack of ten cleaning cards at the link below.

Cleaning Card 10 Pack – SKU 074550

To manually perform a cleaning in PrintHub, go to the Printer Settings tab – Advanced Settings – Output Cutter Cleaning.

Instructions: Cleaning Cards are used to clean the output cutter wheel that cuts between each label or at the end of a group of labels. If the cutting wheel cuts through continuous adhesive backed paper (such as LX610 digital die cutting media), it can accumulate adhesive build-up that will eventually cause cutting problems.

Recommend Cleaning Interval: Every 2000 Labels. PrintHub software tracks this and will alert you when cleaning is necessary.

1. Locate the cleaning card.

2. Peel off the protective strip covering the adhesive.

3. Unload label stock from the printer. Insert the cleaning card into the front output of the printer.

4. When the exposed adhesive strip is aligned with the output cutter path, open PrintHub

Select Printer Settings – Advanced. Click on

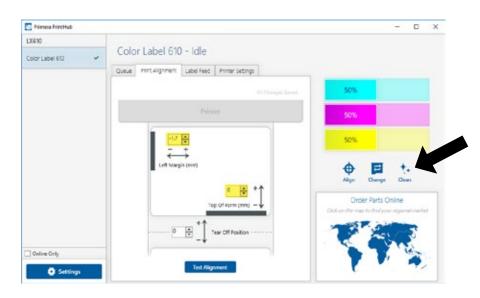

Output Cutter Cleaning. Once the cutter cycles, remove both parts of the card from the printer

7E Cleaning the Cartridge – Poor Print Quality

It may be necessary to clean the ink cartridge nozzles if you notice reduced print quality, or if you suspect a cartridge nozzle has become slightly dried out or clogged. If the cartridge has been left out of the printer more than 30 minutes, the ink in the print head nozzles may have dried. If you are having print quality problems, follow the steps below:

 Before moving on to the next step, ensure that the ink level of the color cartridge is more than 10%. If the ink level is lower than 10%, replace the cartridge.

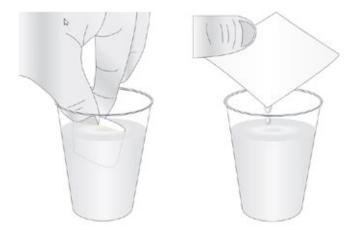

2. Try cleaning the cartridge using the clean function in PrintHub.

- 3. Determine if printing is now acceptable by printing your image. If the sample has missing colors or voids within a color strip, remove the cartridge from the printer and proceed to step 4.
- 4. Prepare items needed for procedure

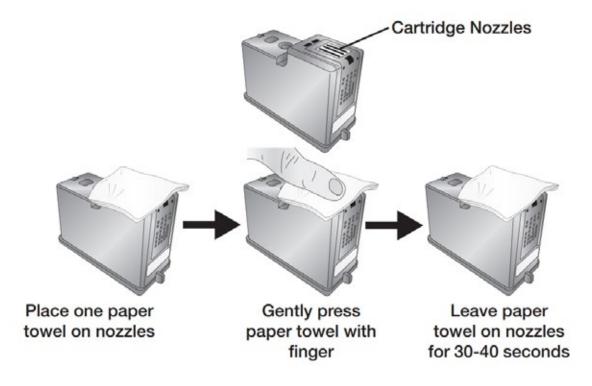

5. Soak the paper towels in water for 5 seconds.

6. Place one paper towel on cartridge nozzles. Gently press the paper towel with your finger. Leave the paper towel on the nozzles for 30-40 seconds.

7. Wipe nozzles.

- a. Place second paper towel on flat/hard surface.
- b. Press the nozzles into the paper towel.
- c. Firmly tap the top of the cartridge three times to force the ink out.
- d. Wipe/Drag the cartridge in the direction indicated.
- e. Repeat until all colors are seen on the paper towel. After wiping the nozzles, the paper towel should show all three colors. If all three colors are present, proceed to step 8. If the paper towel doesn't show all three colors, then repeat step 7. If paper towel still doesn't show all three colors repeating step 7, then replace the cartridge.

8. Dry the cartridge.

Dry excess water from cartridge. Ensure cartridge contacts are completely dry. Printer damage may result if cartridge contacts are not completely dry.

9. Verify cartridge is now functioning properly by printing your label.

7F Technical Support

If you have difficulties operating your Printer, contact technical support using one of the methods listed below.
